Specifically—(a) Any device for reducing gases or vapors to liquid or solid form. The reduction is usually effected by lowering the temperature of the vapor by contact with chilled surfaces. A form of condenser common in the laboratory is shown in the figure. From the flask, *A*, the vapor to be condensed escapes through the tube *b c*, which passes through a larger condenser-tube. A stream of ice-water enters the condenser through *d*, and passes off

through *g*, keeping the surface of the inner tube, *b c*, chilled, and the vapor entering the tube from *A* is condensed and drops from *c* as a liquid. Condensers used to concentrate vapors or gases, as steam, alcoholic vapors, fumes, volatile liquids, etc., commonly depend upon the reducing effects of a lower temperature. In them the vapor, gas, smoke, or fumes are brought into immediate contact with chilled surfaces. This is accomplished in a great variety of ways, as in the surface condenser of the steam-engine, the worm of a still, or the long convoluted tubes in which poisonous fumes or smoke are cooled before being allowed to escape to the chimney. The cooling surfaces are usually kept cold by water, as in the still, the gas-condenser, the sugar-condenser, etc. For fumes and smoke, the contact with walls exposed to the air is sufficient. (b) A part of a cotton-gin which compresses the lint for convenient handling. (c) In *wool-manuf.*, a machine which forms the wool received from the doffer of a carding-engine or comb, and rolls it into slubbings. The doffer of the carding-engine is covered by a series of parallel strips of card-cloth, wrapped about the cylinder. The wool thus comes off in a number of loose flat ribbons of fleece, which in the condensing-machine are carried by a leather apron beneath a roller which has a reciprocating motion transverse to their direction, and thus rolls these slivers into loose slubbings, which are wound upon a roll and are ready for spinning. (d) In the manufacture of sugar, the apparatus used for concentrating the clarified juice, preparatory to its final concentration in the vacuum or evaporating-pan. The liquor trickles over the surface of steam-pipes, where heat evaporates the water which constitutes the greater part of the cane-juice. (e) In optical instruments, a lens, or combination of lenses, used to gather and concentrate the rays of light collected by a mirror and direct them upon the object, as the bull's-eye condenser (see *bull's-eye*, §) and the achromatic condenser used with the microscope.—**Achromatic condenser**. —**Condenser of electricity**, any apparatus by which electricity can be accumulated, usually consisting of two conducting surfaces separated by a non-conductor, as in the condenser of Epinus (see figure), which is charged by connecting one of the plates (*A*) with the electrical machine and the other (*B*) with the ground; their distance from the glass plate (*C*) can be adjusted at will. A practical form of condenser is the Leyden jar (which see, under *jar*). Condensers are much used in connection with submarine telegraphs; one of the Atlantic cables has a condenser with over two acres of surface of tin-foil, arranged in plates separated by waxed paper

The Scotists maintain that it is possible for man in his natural state so to live as to deserve the Grace of God, by which he may be enabled to obtain salvation, this natral fitness (congruitas) for grace being such as to oblige the Deity to grant it. Such is the merit of congruity. The Thomists, on the other hand, contend that man, by the divine assistance, is capable of so living as to merit eternal life, to be worthy (condignus) of it in the sight of God. In this hypothesis, the question of previous preparation for the grace which enables him to be worthy is not introduced. This is the merit of *condignity*." *Hook*, *Eccles. Dict.*

In law: (a) A statement that a thing is or shall be, which constitutes the essential basis or an essential part of the basis of a contract or grant; a future and uncertain act or event not belonging to the very nature of the transaction, on the performance or happening of which the legal consequences of the transaction are made to depend. More specifically, a condition is a provision on the fulfilment of which depends the taking effect or continuance in effect of the instrument or some clause of it, or the existence of some right established or recognized by it, as distinguished from a *covenant*, which is a promise in a sealed instrument the breach of which may give rise to a claim for damages, but not necessarily the forfeiture of any right. The performance of a covenant, however, may be made a condition of the continued efficacy of the agreement. A *condition precedent* is a provision which must be fulfilled or an event which must occur before the instrument or clause affected by it can take effect. A *condition subsequent* contemplates that, after the instrument has taken effect, a right established or recognized by it may be extinguished by some future or uncertain event.

It is distinguished from convection, by which heat and electricity are carried by moving particles; from the radiation of heat, which does not raise the temperature of the intermediate points (except so far as the radiation is hindered); and from the discharge and the electrolytic transfer of electricity.

conductivity (kon-duk-tiv'i-ti), *n.* [*<* *conductive* + *-ity*.] In *physics*, the power of conducting heat, electricity, or sound; the property of being *conductive*. In the case of heat (thermal conductivity) solids have in general a much higher degree of conductivity than liquids, and liquids than gases, the last being practically destitute of conductive power; both liquids and gases become heated by convection (which see), not by conduction. Furthermore, among solids the conductivity of metals for heat is greater than that of stony bodies, that of animal and vegetable substances being the least of all. Metals have also a relatively high degree of conductivity for electricity, a charge of electricity distributing itself freely over a metallic surface, and an electrical current passing more or less readily through a metallic wire. Those metals which are the best conductors of heat, as silver, copper, and gold, are also the best electrical conductors. The conductivity of many solids (glass, sulphur, resin) is nearly zero for electricity; the same is true to a less degree of most liquids and also of gases. With any substance the conductivity for electricity is the reciprocal of the resistance. See *resistance*.

Conductivity varies not only with varying temperature, but also with varying tension, torsion, or pressure.
A. Daniell, *Prin. of Physics*, p. 564.

Béclet . . . employs as the unit of conductivity the transmission, in one second, through a plate a metre square and a millimetre thick, of as much heat as will raise a cubic decimetre (strictly a kilogramme) of water one degree.

Star-nosed Mole (*Condylo cristata*).

tata. The name was really given from the knotted appearance of the tall in dried specimens, when the skin had shrunk on the bones, as represented in some figures of the animal in which the tail looks like a string of beads; it is, however, appropriate, since during the rut the tail swells to double its usual size, and has a gibbous appearance. 2†. The type is the white-backed skunk or conepatl, found in Texas, Mexico, and southward; there are probably other species. Also called *Thiosmus*.

Conepatus is obviously the same as the old Mexican *conepatl*; . . . it probably refers to the burrowing of the animal; for it may be observed, nepantla in the Nahuatl language signified a subterranean dwelling.

Woolsey, Introduct. to Inter. Law, § 104.

Articles of Confederation, in *U. S. hist.*, the compact or constitution adopted by the Continental Congress in 1777 and ratified by the separate colonies within the next four years. The government formed under this compact, which went into effect on March 1st, 1781, was without an executive and judiciary, consisting simply of a congress of one house, in which each State had one vote; it was empowered to declare war and peace, make treaties with foreign powers, direct the land and naval forces in time of war, make requisitions upon the separate States for their quota of the money necessary for national expenses, regulate the value of coin, control the postal service, etc. As it had no power to enforce its laws upon the States, it soon fell into contempt, and on March 4th, 1789, expired by limitation under the provisions of the present Constitution.—**New England Confederation**, the union effected by the colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven in 1643, suggested by the need of a common defense against the Dutch and the Indians. It was discontinued in 1664.—**Syn.** *Confederation, Confederacy, Federation*. A confederation or confederacy is sometimes distinguished from a federation as follows: Both designate a union of distinct states. In a federation, however, the essential sovereignty, as exercised toward foreign countries, is regarded as irrevocably deposited in the hands of the central government, and only a constitutionally limited autonomy in internal matters is retained by the constituent territories; while in a confederation the sovereignty may be conceived as still existing in the constituents and exercised more or less extensively by the general government as delegated agent; a confederacy is regarded as even less permanent than a confederation. Thus, the union of the thirteen colonies before 1789 was a confederation, while the United States since that time have constituted a federation. The above distinction, however, is not strictly adhered to in the ordinary use of these words.

It has become rather difficult to draw any certain line between a congress and a conference. In theory, however, a congress has the power of deciding and concluding, while a conference can only discuss and prepare. Thus the conferences of Moerdyk and Gertrudenberg simply prepared the way for the treaties of Utrecht, while the congresses of Munster, Aix-la-Chapelle, Rastadt, Erfurt, Prague, Châtillon, Vienna, Laybach, and Verona were all more or less direct in their action and results.

The great confessions of faith of the Protestant Christian church are: the Augsburg Confession (1530), a part of the symbol of the Lutheran Church; the first and second Helvetic confessions (1536 and 1566), symbols of the Reformed churches of Switzerland, the latter being approved by nearly all the Reformed churches of the Continent and of England and Scotland; the Gallican Confession (1559), also called the Confession of Rochelle, prepared by Calvin and his pupil De Chandieu, the symbol of the French Protestant church; the Belgic Confession (1561, revised 1619), the symbol of the Reformed churches in Belgium and the Netherlands, and of the Reformed (Dutch) Church in the United States; the first Scotch Confession (1560) and the second Scotch Confession or the National Covenant (1581), the symbols of the Scotch church before the adoption of the Westminster Confession; the Thirty-nine Articles of the Church of England (1563 and 1571); the American revision of the same (1801), the symbol of the Protestant Episcopal Church in the United States; the Irish Article (1615) and the Lambeth Articles (1595), the symbols of the Church of Ireland; the Canons of the Synod of Dort (1619), at present recognized by the Dutch Church, and by the Reformed (Dutch) Church in the United States; the Westminster Confession (1647), the symbol of the Presbyterian Church in England, and of Scotland (taking the place in Scotland of the so-called Scotch confessions), and, with some alterations, of the Presbyterian Church of America; the Savoy Confession (1658), adopted by the Independents at the Savoy palace, London; the declaration of the Congregational Union of England and Wales (1833), of the Boston (United States) National Council (1865), and of the Oberlin National Council (1871), symbols of Congregational churches; the Articles of Religion (1784) of the Methodist Church; the Confession of 1688, and the New Hampshire Confession (1833), symbols of the Baptist Church. 4. [*ML. confessio(n-)*.] The tomb of a martyr or confessor. If an altar was erected over the grave, the name was extended also to the altar and to the subterranean chamber in which it stood. In later times a basilica was sometimes erected over the chamber; the high altar was placed over the altar on the tomb below, and so this high altar also, and subsequently the entire building, was called a *confession*. Also called *confessional*, and in the

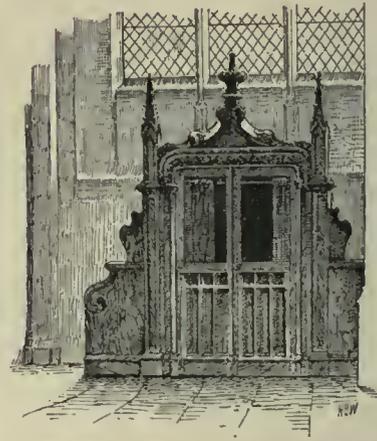

Greek Church *catabasis* or *catabasion*. — **Auricular confession.** See *sacramental confession*, below. — **Confession and avoidance**, in *law*, the substance of a pleading by which the party admits the allegation of his adversary's pleading to be true, but states some new matter by way of avoiding its legal effect. — **Confession of faith.** See 3, above. — **Confession of judgment**, the acknowledgment of a debt by a debtor before a court or a justice of the peace, etc., on which judgment may be entered and execution issued. — **General confession.** (a) A confession made to a priest of sins committed by the penitent since baptism or since infancy, so far as those sins can be remembered; a confession made in preparation for baptism by one baptized after coming to years of discretion, also before admission to a monastic order. (2) The form of confession in the Communion office. — **Judgment by confession**, a judgment obtained on a confession made to a court or a magistrate, or by the withdrawal of the defense, or against a plaintiff by *nolle prosequi*. — **Sacramental or auricular confession**, the act or practice of confessing sins to a priest, for the purpose of receiving absolution. At a very early period, for gross apostasy or other public sins, public confession was required as a condition precedent to partaking of the communion. Public confession was gradually abolished in order to prevent scandal and social and legal complications. Auricular confession was first made universally obligatory in the West as a condition of admission to communion by the fourth Lateran Council in A. D. 1215. It is now required in the Roman Catholic Church from all who are conscious of mortal sins, and is regarded as essential to absolution and divine pardon, and a necessary prerequisite to partaking of the communion. Priests are bound in the strongest manner never to disclose a secret thus confided to them. Confession is obligatory in the Orthodox Greek and in the Armenian Church. The Anglican Church differs from the Roman Catholic and the Eastern Church in not making it obligatory, but leaving it to the conscience of the individual. — **Seal of confession**, in the *Rom. Cath.* and in the *Gr. Ch.*, absolute secrecy incumbent on a priest with regard to all private confessions of sins made to him. A similar secrecy is enjoined by the 13th canon of the Church of England. Also called *the seal*, and *the sacramental seal*.

Confident person, in *Scots law*, a partner in trade; a factor, steward, or confidential man of business; also, a servant or other dependant.—**Syn.** **1.** *Sure*, *Certain*, *Confident*, *Positive*, *Dogmatic*. **2.** *Sure* is the simplest and most general of these words; it has the strength of simplicity. *Certain* suggests the idea of having been freed from doubt, having been made sure. *Confident* belongs especially in the field of reliant action: as, he is *confident* of success. In regard to opinion or belief it may mean no more than *sure*, or it may suggest reliance, as on one's own judgment or upon evidence: as, a *confident* expectation, hope, belief. It implies a desire for that of which one is *confident*. *Positive* runs close to over-confidence or dogmatism: as, he was *positive* that he had made no mistake; it expresses emphatic certainty that will not entertain a doubt of its correctness. (For *dogmatic*, see *magisterial*.) That *confident* and *positive* depend somewhat upon the will, and not merely, like *sure* and *certain*, upon the understanding, is shown by the fact that it is not correct to say "I will not be *certain*, or *sure*, about this," while it is correct to say "I will not be *positive*, or *confident*, about it."

(e) *Eccles.*: (1) A rite whereby baptized persons are admitted to full communion with the church. In the Roman Catholic, Greek, and Anglican churches it consists of the imposition of hands and prayer by a bishop (or in the Greek Church by episcopal authority), preceded in the two former by unction and anointing with chrism. In the first two churches it is regarded as the confirming or strengthening of the grace given in baptism and the bestowal of the gifts of the Spirit. In the Anglican Church, high-churchmen and low-churchmen regard it from different points of view, the latter attaching special importance to the personal renewal made in it, by the persons confirmed, of the vows taken by others in their name at baptism, while the former believe it to be essentially a sacramental rite, conveying the strengthening power of the Holy Ghost. This rite is believed to be recorded in the New Testament as a laying on of hands following baptism, distinct from ordination, and administered by apostles only. Uction was discontinued in the Anglican Church not long after the Reformation. In the early church confirmation immediately followed baptism, and the Greek Church has always retained this practice; in the West, however, the two have been separated since the thirteenth century by an interval of seven years or more. Formerly confirmation was sometimes allowed to be administered by presbyters if authorized by the bishop; and this is still the case in the Greek Church, where it is administered by priests with chrism consecrated by a bishop. Confirmation is one of the seven great religious rites, distinctively called *sacraments* by the Roman Catholic Church, and *sacramenta* or *mysteria* by the Greek. The Anglican formularies mention it as one of "five commonly called sacraments," but do not place these in the same rank with baptism and the Lord's supper as sacraments "ordained of Christ our Lord in the Gospel." (See *sacrament*.) In the Lutheran and Reformed churches the rite is administered by the pastors. Other Protestant denominations reject it.

The Fathers . . . held *confirmation* as an ordinance apostolic always profitable in God's Church. *Hooker, Eccles. Polity, v. 60.*

He sought (unsuccessfully) to remedy the degeneracy and oppressions of his time, and to secure peace and prosperity to the empire, by the spread of learning and the inculcation of virtue, setting up as models to be imitated the "ancient kings" Yao and Shun (about 2356-2204 B. C.), who, by their virtue and the force of their individual character, were said to have removed evil, poverty, and ignorance from the empire. The system of Confucius was essentially mundane in its methods and aims, being based upon the proper discharge of the duties involved in the five relationships of life, namely, those of prince and subject, parent and child, brother and brother, husband and wife, and friend and friend. By many Confucianism is called one of the three religions of China, the others being Taoism and Buddhism. In this sense the term includes both the Confucian scheme of ethics and statecraft and the ancient native religion (for

which the name *Sinism* has been proposed) existent in China from the dawn of Chinese history, and still observed as the state religion. Its chief features are: (1) the worship of the Supreme Being (Shang-ti) by the emperor on behalf of the people; (2) the worship of "the host of spirits," as the gods of the winds, of the rivers, of the mountains, the grain, etc., by the officials and dignitaries; and (3) the observance of ancestral worship and filial piety by all. (See *Sinism*.) By other the term has been still further extended, so as to include the cosmogonic speculations of Chu-hi and the other speculative philosophers of the twelfth century. The only Chinese term corresponding in any degree to the word *Confucianism* is *Yu-Kiao*, 'the system of the learned.'

Confucianism pure and simple is in our opinion no religion at all. The essence of *Confucianism* is an antiquarian adherence to traditional forms of etiquette—taking the place of ethics; a sceptic denial of any relation between man and a living God—taking the place of religion; while there is encouraged a sort of worship of human genius, combined with a set of despotic political theories. But who can honestly call this a religion? *China Rev.*, VIII. 59.

I use the term *Confucianism* . . . as covering, first of all, the ancient religion of China, and then the views of the great philosopher himself, in illustration or modification of it.

5. Formerly, in the English colonies of North America, a parish, hundred, town, plantation, or other settlement.—6. In the *Rom. Cath. Ch.*: (a) One of the committees of cardinals appointed by the pope to aid him in the transaction of the business of the church. The decisions of these congregations are ordinarily regarded as equivalent to decisions of the pope himself. There are eleven regular congregations, namely: (1) the *Congregation of the Consistory*, which prepares the business to be brought before the consistory or assembly of all the cardinals (see *consistory*, 4); (2) the *Congregation of the Holy Office of the Inquisition*, which tries all cases of heresy brought before it, and formerly heard appeals from lower inquisitorial courts, and sent inquisitors where needed (see *inquisition*); (3) the *Congregation of the Index*, which decides what books shall be placed upon the Index Expurgatorius, or list of forbidden books (see *index*); (4) the *Congregation of Rites*, whose duty is to promote a general uniformity of the externals of divine worship, and to decide with regard to the beatification and canonization of any one whose name is proposed therefor; (5) the *Congregation of Immunities*, which is charged with the duty of determining all matters concerning the right of asylum, and such as relate to ecclesiastical jurisdiction where it comes in contact with the civil power; (6) the *Congregation of the Fabric*, which is charged with everything that relates to the conservation of St. Peter's; (7) the *Congregation of the Council* (that is, of Trent), which is the official interpreter of the decrees of the Council of Trent on all matters of discipline whenever questions arise thereon, the interpretation of its articles of faith being reserved to the pope himself; (8) the *Congregation of Bishops and Regulars*, which disposes of such differences as may arise between the bishops and the regular communities within their respective dioceses; (9) the *Congregation of Discipline*, which superintends the interior discipline of monastic establishments; (10) the *Congregation of the Propaganda*, which has charge of the missions of the church, and of the College of Propaganda, an institution at Rome for the instruction of men intended for missionary work (see *propaganda*); (11) the *Congregation of Indulgences*, which superintends the examination and certification of the authenticity of relics and the grant of indulgences. Other special congregations are also appointed by the pope. *Cath. Dict.* (b) A religious community bound together by a common rule, but not by the solemn and irrevocable vows which characterize the monastic orders. Among them are the Oratorians, the Dames Anglaises, the Fathers of the Mission or Lazarists, the Oblates, the Passionists, the Redemptorists, the Marists, and the Christian Brothers. (See *Christian Brothers*, under *Christian*.) (c) A group of monasteries which agree to practise the rules of their order more strictly in their respective houses, and unite themselves together by closer ties, such as the congregations of Cluny and St. Maur.

As a broad general rule, nearly every post-Reformation institute is styled, not an "Order," but a "Congregation"; but the only distinction which can be drawn between these two names is that "order" is the wider, and may include several congregations within itself (as the Benedictine order, for example, includes the congregations of Cluny and of St. Maur), while a congregation is a simple unit, con-

plete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own.

Encyc. Brit., XVI. 715.

(d) A committee of bishops appointed by the pope, or with his approbation, to prepare rules of business, etc., for a general council. In the General Council of Constance the congregation was differently constituted, the Council being divided into congregations according to the nationalities represented—German, French, Italian, English, and subsequently Spanish. These voted separately, preliminary to the final action of the Council as a whole.

Thus, if $A = 0$ is the equation of one locus, and $B = 0$ that of another, then $AB = 0$ is the equation to the congregation of them.—**Congregation of Our Lady of Calvary**, a French order of Benedictine nuns founded at Poitiers in the beginning of the seventeenth century, broken up by the revolution, but afterward reorganized and reestablished.—**Congregation of the Mother of God**, a monastic order instituted about 1574 at Lucca in Tuscany by John Leonardi, and approved and confirmed by the papal sec.—**Free Congregations**, also called *Friends of Light* or *Protestant Friends*, a name adopted by congregations of German rationalistic religious thinkers, who broke away from the established church of Prussia about 1845. They denied the authority of the Bible and the truth of important Christian doctrines, and some of them also the existence of a personal Deity. As they became politically powerful, they were suppressed in Saxony and Bavaria, and continued to exist in Prussia only under great difficulties. There are some of these congregations in the United States.—**Lords of the Congregation**, in *Scot. ch. hist.*, a title given to the chief nobles and gentlemen who signed the Covenant of December 3d, 1557, for liberty of worship. The whole body of adherents was called the *Congregation*, from the frequent recurrence of the word *congregation* in the document. = *Syn.* 4. See *spectator*.

congregational (kong-grĕ-gā'shon-əl), a. [*congregation* + -al.] 1. Of or pertaining to a congregation: as, congregational singing.—2. *Eccles.*, pertaining to government by congregations; governed by its own congregation, as a church; specifically (with a capital), pertaining to Congregationalism as a denominational designation: as, the congregational polity of the Baptists; the Congregational churches of the United States.

The great Baptist denomination—with some leaning toward Independency properly so called—is yet purely Congregational in its principle of church order and government. *H. M. Dexter, Congregationalism* (2d ed.), 1.

Congregational council. See *council*.—**Congregational music**, music in which the congregation take part, as opposed to music sung by the choir only. = *Syn.* *Congregational, Independent*. See extract under *congregationalism*.

congregationalism (kong-grĕ-gā'shon-əl-izm), n. [*congregational* + -ism.] 1. A system of church government based upon the autonomy of the individual congregation. It embodies three fundamental principles—(1) that it is the right and duty of believers in Jesus Christ in every community to organize for Christian work and worship, and that such an organization is a Christian church; (2) that each such church is by right independent of all external ecclesiastical control, and in any such church all members possess equal ecclesiastical authority; (3) that such churches owe a duty of Christian fellowship and cooperation to one another. This fellowship and cooperation is exercised among those who bear the name of Congregationalists by means of councils, conferences, associations, and associations. The principles of congregationalism are maintained not only by Congregationalists so called, but also by Baptists, Unitarians, Universalists, and some other denominations of Christians, and by many evangelical churches in France, Switzerland, etc.

Congregationalism is the democratic form of church order and government; it derives its name from the prominence which it gives to the congregation of Christian believers. It vests all ecclesiastical power (under Christ) in the associated brotherhood of each local church, as an independent body. At the same time it recognizes a fraternal and equal fellowship between these independent churches, which invests each with the right and duty of advice and reproof, and even of the public withdrawal of that fellowship in case the course pursued by another of the sisterhood should demand such action for the preservation of its own purity and consistency. Herein *Congregationalism* as a system differs from *Independency*, which affirms the seat of ecclesiastical power to reside in the brotherhood so zealously as to ignore any check, even of advice, upon its action.

H. M. Dexter, Congregationalism (2d ed.), 1.

2. [*cap.*] The system of ecclesiastical polity and religious doctrine maintained by the Congregational Church. See *congregationalist*.

congregationalist (kong-grĕ-gā'shon-əl-ist), n. [*congregational* + -ist.] 1. One who holds to the congregational principles of church government. See *congregationalism*, 1. In this sense, Bap-

tists, Unitarians, Universalists, some Methodists, and some other denominations of Christians are congregationalists. 2. [*cap.*] One of a denomination of Christians who hold to the congregational principle of church government, to the system of doctrines known as evangelical or orthodox, to the legitimacy of the baptism of infants, and to baptism by sprinkling. The Congregationalists of the United States are identical in origin and general principles with the Independents (now also called *Congregationalists*) of Great Britain. They were the predominant religious body in the first settlement of New England, and have thence spread over the United States, especially in the Northern and Middle States. Their churches are independent of one another; their various ecclesiastical assemblies—councils, conferences, associations, associations—possess no ecclesiastical authority, but only a moral power; and they are generally moderate Calvinists in theological doctrines. Their missionary operations are carried on by means of voluntary societies supported by the churches, but only indirectly amenable to them.

congregationally (kong-grĕ-gā'shon-əl-i), adv. In a congregational manner; by congregations; as a congregation.

2. The meeting of persons in sexual commerce.

—3. A formal meeting or association of persons having a representative character; an organization or authorized assemblage of persons for the consideration of some special subject or the promotion of some common interest; particularly, in *politics*, an assemblage of envoys, commissioners, or plenipotentiaries representing sovereign powers, or of sovereigns themselves, for the purpose of arranging international affairs: as, the Congress of Vienna (1814–15); the Congress of Paris (1856). For the distinction between *conference* and *congress*, see *extraet* under *conference*, 2 (a).

As soon as the employers attempted to give work to subcontractors, they forced them by strikes to take it back. The society [of haters] was called the Congress, was regulated by statutes, and framed bye-laws. All workmen of the trade belonged to it. *English Guilds* (E. E. T. S.), Int., p. cixlviii.

The congress of Aix la Chapelle, at which the five great powers were represented, . . . was intended to exercise a supervisory power over European affairs, interfering to prevent all dangerous revolutions, especially when they should proceed from popular movements. *Woolsey, Introduct.* to *Inter. Law*, § 66.

Farmers' congress, an association of agriculturists of the United States, which has met annually since 1881. *Appleton's Ann. Cyc.*, 1886, p. 330.

4. [*cap.*] The national legislature of the United States. In *U. S. hist.* there have been three differently constituted bodies so named: (a) *The Continental Congress*, representing the thirteen colonies. What is known as the first Continental Congress, with delegates from all the colonies but Georgia, met in Philadelphia September 5th, 1774, and lasted until October 26th, 1774; the second, in which all were represented, met in Philadelphia May 10th, 1775, and adjourned December 12th, 1776; the third met in Baltimore December 20th, 1776, and lasted until the Articles of Confederation went into operation, March 1st, 1781. (b) *The Congress of the Confederation*, representing the States under the Articles of Confederation, March 1st, 1781, to March 4th, 1789. (c) *The Congress of the United States*, which represents both the States and the people under the Constitution, and which met for the first time March 4th, 1789. It consists of two houses, the Senate and House of Representatives (sometimes called the upper and lower houses), and meets at least once every year. The Senate is composed of two members from each State, elected (by its legislature) for a period of six years, one third of them being elected every second year. The number of representatives varies in each State in proportion to the population. (See *apportionment*, 2.) They sit for two years only. The united body, for the two years during which the representatives hold their seats, receives a numerical designation as a single Congress, counting from the first. Thus, the senators and representatives sitting during the period March 4th, 1895, to March 4th, 1897, constituted the 54th Congress. The most important powers of Congress, as enumerated in the Constitution, are: to impose and collect taxes, borrow and coin money, regulate commerce, establish uniform naturalization and bankruptcy laws, declare war, raise armies, maintain a navy, suspend the writ of habeas corpus, admit new States, and make all laws necessary to carry these powers into execution. In addition, the Senate confirms or rejects treaties, and nominations to office made by the President.

The substitution of "*Congress*" for "the legislature of the United States," requires no explanation. It is a mere change of phraseology. *Calhoun, Works*, I. 256.

The upper house of Congress is therefore a federal while the lower is a national body, and the government is brought into direct contact with the people without endangering the equal rights of the several states.

J. Fiske, Amer. Pol. Ideas, p. 97.

5. The name of the lower house of the Spanish Cortes, and of the national legislatures of the South American republics.—**Church Congress**, a name applied to two voluntary organizations, one in the Church of England, the other in the Protestant Episcopal Church in the United States of America, for the free discussion of topics of church interest. Membership is confined to those who are in communion with the church. Neither body possesses any ecclesiastical authority or responsibility, or attempts any legislative functions. The same name, with modifying adjectives, as *Inter-ecclesiastical Congress*, *Inter-denominational Congress*, etc., has been applied to other bodies of a similar character embracing members of various Protestant communions.—**Congress hoots**. See *hoot*.—**Congress water**. See *mineral water*, under *mineral*.—**Peace Congress**, in *U. S. hist.*, a conference, in February, 1861, of delegates from free and border slave States, which made unsuccessful efforts to avert civil war by means of proposed amendments to the Constitution, dealing chiefly with slavery. Also called *Peace Convention* or *Conference*.—**Provincial congresses**, popular conventions which, at the beginning of the struggle between the American colonies and England, assumed control of the colonies.—**Stamp-Act Congress**, a body of delegates from nine colonies which met at New York, in 1765, to protest against the Stamp Act and other oppressive measures of the British Parliament.

2. Specifically, in *math.*, of or pertaining to a cone: as, *conic sections*.—**Conic section** [NL. *sectio*

conica, Gr. *κωνική τομή*], a curve formed by the intersection of a plane with a right circular cone. If the plane is more inclined to the axis of the cone than is the side of the cone (fig. 3), the intersection is oval and is called an *ellipse*. The circle is one limit of the ellipse—that, namely, in which the plane becomes perpendicular to the axis of the cone. If the plane is less inclined to the axis of the cone than is the side of the cone, it will also cut the second sheet of

Conic Sections.

The two principal forms are fig. 5, giving the hyperbola, and fig. 3, giving the ellipse. Fig. 4 is the intermediate case, giving the parabola. The degenerate form of the hyperbola is a pair of straight lines, as shown in fig. 1. Fig. 2 shows the circle as a special case of the ellipse having no special relations to the infinitely distant part of the real plane, though it passes through two fixed imaginary points on the line at infinity.

the cone on the other side of the vertex (fig. 5), and the twofold curve thus generated is a *hyperbola*. A particular case of the hyperbola, produced when the plane passes through the vertex of the cone, is that of two intersecting straight lines, called a *degenerate conic*. Intermediate between the ellipse and the hyperbola is the case where the plane is parallel to the side of the cone (fig. 4), and the curve thus produced is a *parabola*. The degenerate form of the ellipse is a point, that of the parabola a straight line. The degenerate forms are not true conics, because they are of the first class, the conics being of the second class.—**Spherical conic section**, a curve produced by the intersection of a sphere with a cone.

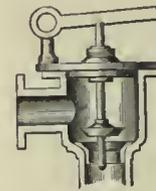

II. n. 1. A conic section (which see, under *I.*); a plane curve of the second order and second class, or the equation to such a curve.—**2. pl.** See *conics*.—**Axis of a conic**. Conical bearing. See *bearing*.—**Conical gearing**. See *gearing*.—**Conical map-projection**, the projection of the earth first upon a tangent or secant cone with the subsequent development of the cone. The best-known conical projection is *Bonne's*, used for the map of France. "In constructing a map on this projection, a central meridian and a central parallel are first assumed. A cone, tangent along the central parallel, is then assumed, and the central meridian developed along that generator of the cone which is tangent to it, and the cone is then developed on a tangent plane. The parallel falls into an arc of a circle with its center at the vertex, and the meridian becomes a graduated right line. Concentric circles are then conceived to be traced through points of this meridian at elementary distances along its length. The zones of the sphere lying between the parallels through these points are next conceived to be developed, each between its corresponding parallels. Thus all the parallel zones of the sphere are rolled out on a plane in their true relations to each other and to the central meridian, each having in projection the same width, length, and relation to the neighboring zones as on the spheroidal surface. As there are no openings between consecutive developed elements, the total area is unaltered by the development. Each meridian of the projection is so traced as to cut each parallel in the same point in which it intersected it on the sphere." *Craig*, *Treatise on Projections*, p. 72.—**Conical point**, in *geom.*, a point on a surface such that every line through it meets the surface in two coincident points.—**Conical pupæ or chrysalides**, in *entom.*, those pupæ or chrysalides which have no angular processes, and are more or less conical in form. This is the common type among nocturnal *Lepidoptera*.—**Conical refraction**. See *refraction*.—**Conical surface**, any surface generated by the motion of a right line having one point fixed.—**Conical valve**, the puppet-valve or T-valve, first used by Watt in the construction of

It is cosmopolitan, but is especially abundant in temperate and mountainous regions, often forming in the northern hemisphere vast forests. It consists of trees or shrubs, mostly evergreen and resinous, usually with subulate (awl-shaped), needle-shaped, or scale-like rigid leaves, and with monocious or rarely dioecious naked flowers. The male flower consists of an indefinite number of stamens upon a central axis, the anthers being frequently suspended from the under side of a petalate scale. The fertile ament consists of scales bearing naked ovules, and in fruit becomes a dry cone or a fleshy and drupe-like. The embryo has often several cotyledons in a whorl. The wood, as in all gymnosperms, is characterized by having the sides of the cells dotted with what are called bordered pits or discoid markings. The order includes 32 genera and about 300 species, and is divided into the following tribes: (a) *Abietinae*, bearing cones formed of spirally imbricated two-seeded scales; to this belong the pine, fir, spruce, larch, cedar, etc. (b) *Araucariæ*, with similar cones having one or several seeds to each scale, represented by *Araucaria* and *Agathis* in the southern hemisphere, and by two monotypical genera in China and Japan. (c) *Podocarpeæ*, likewise of the southern hemisphere and eastern Asia. (d) *Taxodinae*, including the big tree of California (*Sequoia*), the bald cypress (*Taxodium*), and a few species of Australia and Japan. (e) *Cupressinae*, having cones with decussately opposite scales, or sometimes drupe-like, as the cypress, juniper, arbor-vitæ, and the North American cedars. (f) *Taxaceæ*, with fruit consisting usually of a single seed surrounded by a fleshy disk or coat. This tribe is by some considered a separate order, and includes the yew (*Taxus*), *Torreya*, the ginkgo of China, and some other small genera of Australia and Australasia. (b) A class of verbs similarly conjugated: as, Latin verbs of the third *conjugation*. (c) In Hebrew and other Semitic languages, one of several groups of inflections normally formed from the same verb, and expressing a modification of meaning analogous to that found in certain classes of derivative verbs in Indo-European languages, or to the voices of these. [The Latin *conjugatio* is a translation of the Greek *συνζυγία*, properly *derivation*, including inflection as well as formation of new words, but afterward limited to the inflection of verbs, which had previously been called simply *inflection*, or *inflection of verbs* (*κλίσεις ῥημάτων, declinatio verborum*).]

3. A union or coupling; a combination of two or more individuals. [Obsolete except in specific use. See 4.]

4. In *biol.*, a union of two distinct cells for reproduction; a temporary or permanent growing together of two or more individuals or cells, with fusion of their plasmodic substance, as a means of reproduction by germs or spores, or a means of renewing individual capacity to multiply by fission. It is a kind of copulation of the entire bodies of different individuals or cells, with the formation of new nuclei or other form-elements, preparatory to the

Cells of a Seaweed (*Spirogyra elongata*) Conjugating, highly magnified.

1. Portions of two filaments preparing for conjugation; a protuberance has arisen from each cell to meet a similar one from the opposite cell. 2. A. portions of two filaments whose cells are in the act of conjugating. At the left the protoplasmic body of one cell is passing through and coalescing with that of the opposite cell; at the right this has already taken place. B. portion of a filament containing young zygospores, each surrounded by a cell-wall. (From Sachs's "Lehrbuch der Botanik.")

development of new individuals. It is also called *zygosis*, and the resulting hended organism is called a *zygote* or *zygospore*. The process occurs only in the lower animals and plants, among many of which it is an ordinary mode of reproduction. It is very common in protozoans, and has been observed in certain worms. (See *Diplozoön*.) A permanent fusion takes place in the unicellular alga *Diatomaceae* and *Desmidiaceae* by the union of the contents of two separate cells; in the *Zygnemataceae* and *Mezocarpae*, by that of two cells of different filaments or of the same filament; and in the *Zodoporeae*, by that of zygospores from different mother-cells. The result of the union in each case is called a *zygospore*; the latter produces a plant sim-

ilar to that from which it came. The process is considered a sexual one, though the cells which unite cannot be distinguished as male and female.

The *conjugation* of the Algae and of some of the simplest animals is the first step towards sexual reproduction.

Darwin, Cross and Self Fertilisation, p. 409.

The *conjugation* of two Infusoria occurs in very different ways, and leads to more or less complete fusion, which, after regeneration of the nucleus, is followed by an increase in the frequency of fission. Paramecium, Stentor, Spirostoma, during *conjugation*, become connected by their ventral surfaces; other Infusoria, with a flat body like Oxytrichina or Chilodon, by their sides; while Eucheleya, Halteria, Coleps, join together the anterior extremities of their bodies, giving the appearance of transverse fission. A lateral *conjugation* also takes place not infrequently in Vorticella, Trichodina, etc., between individuals of unequal size, the smaller one having the appearance of a bud.

In low vertebrates it is rudimentary and non-secretory, or not to be demonstrated; in the higher vertebrates which have eyelids it is well defined. In birds and many reptiles and mammals it forms a special fold, chiefly constituting the nictitating membrane or third eyelid. It is very delicate where it passes over the cornea, offering no impediment to vision. In snakes which have no eyelids a delicate cuticle continues from the skin over the eye, and is shed with the rest of the cuticle. The membrane is regarded as one of the tunics or coats of the eyeball, like the *tunica sclerotica*, etc.

In regard to the word black, we merely annex to it the syllable *ness*; and it is immediately indicated that all *connotation* is dropped. James Mill, Human Mind, ix.

2. That which constitutes the meaning of a word; the aggregation of attributes expressed by a word; that which a word means or implies: distinguished from *denotation*. See *extract*, and *connote*, *v.*

The more usual mode of declaring the *connotation* of a name is by predicating two or more connotative names which make up among them the whole *connotation* of the name to be defined, as, Man is a corporeal, organized, animated, rational being, shaped so and so; or we may employ names which connote several of the attributes at once, as, Man is a rational animal shaped so and so. J. S. Mill, Logic, i. viii. § 2.

connotative (kon-ō-tā-tiv), *a.* [= F. *connotatif* = Sp. Pg. *connotativo*, < ML. *connotativus*, < **connotatus*, ppr. of *connotare*, connote: see *connote*, *connotate*.] Having the quality of connoting; implying an attribute while denoting a subject: applied to any term which connotes or connotes anything, in whatever sense these verbs may be used. [The Latin equivalent *connotativus* is frequent in the scholastic writers, from Alexander of Hales, one of the earliest, who gives *relativa appellatio* as the equivalent of *nomen connotans*, to William of Occam, who says: "A *connotative* name is that which signifies one thing primarily and another secondarily; and such a name properly has a nominal definition, . . . and frequently a part of that definition ought to be placed in the nominative and part in an oblique case. . . . as with the noun *white*, . . . that which possesses whiteness." The word is used in this sense in older English writers. Several modern writers, as James Mill, have used it in nearly the same way; but J. S. Mill's influence has established, alongside of the old meaning, another, used by his followers, which is defined in the following extract:

A *connotative* term is one which denotes a subject, and implies an attribute. By a subject is here meant anything which possesses attributes. Thus John, or London, or England, are names which signify a subject only. Whiteness, length, virtue, signify an attribute only. None of these names, therefore, are *connotative*. But white, long, virtuous are *connotative*. The word white denotes all white things, as snow, paper, the foam of the sea, etc., and implies, or, as it was termed by the schoolmen, connotes, the attribute whiteness. J. S. Mill, Logic, i. ii. § 5.]

Connotative being. See *being*. connote (kon-nōt'), *v.*; pret. and pp. *connoted*, ppr. *connoting*. [= Sp. *connotar*, < ML. *connotare*, connote, < L. *com-*, together, + *notare*, mark, note: see *note*, *v.*, and cf. *connotate*.] I. *trans.* 1. Same as *connotate*.

Good, in the general sense of it, connotes also a certain suitability of it to some other thing. South.

White, in the phrase white horse, denotes two things, the color and the horse; but it denotes the color primarily, the horse secondarily. We say that it notes the primary, connotes the secondary signification. James Mill, Human Mind, i.

2. To signify; mean; imply.

It [*Cosmos*] denotes the entire phenomenal universe; it connotes the orderly uniformity of nature, and the negation of miracle or extraneous disturbance of any kind. J. Fiske, Cosmic Philos., i. 182.

[This meaning was introduced by J. S. Mill. A word *connotes* those attributes which its predication of a subject asserts that that subject possesses. But *connote* is now often loosely used in such a sense that any attribute known to be possessed by all the objects denoted by a term is said to be *connoted* by that term. Mill discountenances this use of the word.

In some cases it is not easy to decide precisely how much a particular word does or does not *connote*; that is, we do not exactly know (the case not having arisen) what degree of difference in the object would occasion a difference in the name. Thus, it is clear that the word man, besides animal life and rationality, connotes also a certain external form; but it would be impossible to say precisely what form; that is, to decide how great a deviation from the form ordinarily found in the beings whom we are accustomed to call men would suffice in a newly discovered race to make us refuse them the name of man. J. S. Mill, Logic, i. ii. § 5.]

= *Syn.* Note, Denote, Connote. See the definitions of these words.

II. *intrans.* To have a meaning or signification in connection with another word.

=Syn. 1 and 3. *Overcome*, *vanquish*, *conquer*, *subdue*, *subjugate*, to overpower, overthrow, defeat, beat, rout, worst, discomfit, humble, crush, subject, master, agree in the general idea expressed by *overcome*, namely, that of becoming superior to by an effort. The most conspicuous use of these words is in relation to physical struggles, as in war, wrestling, etc., but they refer also to struggles of mind, as in statesmanship, debate, chess, etc. An important difference among them is the implied duration of the victory, *overcome* and *vanquish* not reaching beyond the present, *conquer* implying a good deal of permanence, and *subdue* and *subjugate* containing permanence as an essential idea. *Overcome* is not so strong as *vanquish*, the former expressing a real victory, but the latter also a complete or great one. *Conquer* is wider and more general than *vanquish*, and may imply a succession of struggles or conflicts, while *vanquish* and *overcome* refer more commonly to a single conflict. Alexander the Great conquered Asia in a succession of battles, and *vanquished* Darius in one decisive engagement. In this respect *subdue* and *subjugate* are like *conquer*. *Subdue* may express a slower, quieter process than *conquer*. *Subjugate* is the strongest; it is to bring completely under the yoke. See *defeat*.

Consensual contract, in *civil law*, a contract which, though made without the formalities of delivery, writing, or entry in account, was enforceable on the ground that in cases of sale, partnership, agency, and hiring proof of the consent of the parties was enough.

The term *Consensual* merely indicates that the obligation is here annexed at once to the *Consequens*. The *Consequens*, or mutual assent of the parties, is the final and crowning ingredient in the *Convention*, and it is the special characteristic of agreements falling under one of the four heads of Sale, Partnership, Agency, and Hiring, that, as soon as the assent of the parties has supplied this ingredient, there is at once a *Contract*. The *Consequens* draws with it the obligation, performing, in transactions of the sort specified, the exact functions which are discharged, in other contracts, by the *Res* or *Thing*, by the *Verba stipulationis*, and by the *Littere* or written entry in a ledger. *Consensual* is therefore a term which does not involve the slightest anomaly, but is exactly analogous to *Real, Verbal*, and *Literal*. *Maine*, Ancient Law, p. 322.

The perfect consonances are the unison, the octave, the fifth, and the fourth; the imperfect are the major and minor thirds and the major and minor sixths. The effect of consonance is due to the simplicity of the ratio between the vibration-numbers of their constituent tones. Thus, the ratio of the unison is 1:1; of the octave, 2:1; of the fifth, 3:2; of the fourth, 4:3; of the major sixth, 5:3; of the major third, 4:3; of the minor third, 3:2; of the minor sixth, 5:4. II. n. An alphabetic element other than a vowel; one of the closer, less resonant and continuous, of the sounds making up a spoken alphabet; an articulate utterance which is combined, to form a syllable, with another opener utterance called a vowel. Consonants are the closer, and vowels the opener, of the sounds that make up the alphabetic scale or system of a language. But there is no absolute line of distinction between the two classes; and the openness of the consonants may be and are used as vowels also. Thus, the same *t*-sound is consonant in *apply*, and vowel in *apple*; *n* is consonant in *burned*, but vowel in *burden*; and in some languages, as Sanskrit and Polish, *r* is much used as a vowel. On the other hand, *y* and *io* are hardly, if at all, distinguishable from *ee* and *oo*. Such consonants, as standing near the boundary between consonant and vowel, are often called *semi-vowels* (also *liquids*). According to their degree of closeness, consonants are divided into *mutes* (or *stops*, or *checks*, or *explosives*), as *b* and *p*, which involve a complete cutting off of the passage of the breath: *fricatives* (*spirants* and *sibilants*, etc.), as *th* and *dh* (TH), *f* and *v*, *s* and *z*, in which a rustling or friction of the breath through a nearly closed position of the organs is the conspicuous element; *nasals*, as *n*, *m*, and *ng*, accompanied with admission of the in-tonated breath to the nose and its resonance there; and *semi-vowel* or *liquid* sounds, as already illustrated. According to the organs used in producing them, they are divided into *labials*, made with the lips, as *b*, *f*, *v*, *m*; *dentals* or *linguals*, made with the tip of the tongue at or near the teeth, as *t*, *d*, *th*, *dh* (TH), *n*; *palatals* or *gutturals*, made with the back of the tongue, as *k*, *g*, *ng*; and some languages have various other classes. Then, according as they are made with simple breath, or with breath vocalized or made sonant in the larynx, they are divided into *sturd* or *breathed*, as *p*, *t*, *f*, *s*, etc., and *sonant* or *voiced* or *vocal*, as *b*, *d*, *v*, *z*, etc. (Sometimes wrongly distinguished as *hard* and *soft*, as *strong* and *weak*, as *sharp* and *flat*, and so on). See these various terms, and *syllable*.

'count of the stable,' master of the horse: L. *comes*, a follower, etc.; *stabuli*, gen. of *stabulum*, a stable: see *count*² and *stable*.] 1. An officer of high rank in several of the medieval monarchies. The Lord High Constable of England was the seventh officer of the crown. He had the care of the common peace in deeds of arms and matters of war, being a judge of the court of chivalry, or court of honor. To this officer, and to the earl marshal, belonged the cognizance of contracts touching deeds of arms without the realm, and combats and blazonry within the realm. His power was so great, and was often used to such improper ends, that it was abridged by the 13th Richard II., and was afterward forfeited in the person of Edward Stafford, Duke of Buckingham, in the reign of Henry VIII. It has never been granted to any person since that time, except on a particular occasion. The office of Lord High Constable of Scotland is one of great antiquity and dignity. He had formerly the command of the king's armies while in the field, in the absence of the king. He was likewise judge of all crimes or offenses committed within four miles of the king's person, or within the same distance of the parliament or of the privy council, or of any general convention of the states of the kingdom. The office has been hereditary since 1314 in the family of Hay, earls of Erroll, and is expressly reserved in the treaty of union. The Constable of France was the first officer of the kings of France, and ultimately became commander-in-chief of the army and the highest judge in all questions of chivalry and honor. This office was suppressed in 1627. Napoleon reestablished it during a few years, in favor of his brother Louis Bonaparte. The constable of a castle was the keeper or governor of a castle belonging to the king or a great noble. This office was often hereditary; thus, there were constables or hereditary keepers of the Tower, of Normandy, and of the castles of Windsor, Dover, etc.

The constabill of gude Dundee,
The vanguard led before them all.
Battle of Harlaw (Child's Ballads, VII. 185).

The Constables of France repeatedly shook or saved the French throne. *Maine*, Early Hist. of Institutions, p. 139.

2. An officer chosen to aid in keeping the peace, and to serve legal process in cases of minor importance. In England constables of hundreds, or high constables (now in many districts called chief constables), are appointed either at quarter-sessions or by the justices of the hundred out of sessions; petty constables, or constables of villis or tithings, are annually sworn into the office at quarter-sessions for each parish, upon presentation of the vestry, and are subordinate to the high or chief constables. In the United States the constable is an official of a town or village, elected with the other local officers, or, as a special constable, acting under a temporary appointment. The constable was formerly of much more consequence both in England and the colonies, being the chief executive officer of the parish or town.

The constable was formerly the chief man in the parish, for then the parish was responsible for all robberies committed within its limits if the thieves were not apprehended. . . . But this state of things has long passed away; . . . and although constables are in some few instances still appointed, their duties are almost entirely performed by the county police. And it was provided by an Act of 1872 that for the future no parish constable should be appointed unless the County Quarter Session or the Vestry should determine it to be necessary.

A. Fonblanque, Jr., How we are Governed, p. 69.

See above, 2.—**Parish constable**, in England, a petty constable exercising his functions within a given parish.—**Special constable**, a person sworn to aid the constituted authorities, military or civil, in maintaining the public peace on occasions of exigency, as to quell a riot.—**To outrun the constable.** (a) To escape from the subject in dispute when one's arguments are exhausted. *S. Butler*. (b) To live beyond one's means. In this latter sense also *ouerrun* the constable. [Colloq.]

"Harkee, my girl, how far have you *ouerrun* the constable?" I told him that the debt amounted to eleven pounds, besides the expence of the writ. *Smollett*, Roderick Random, xxiii.

Poor man! at th' election he threw, t'other day,
All his victuals, and liquor, and money away;
And some people think with such haste he began,
That soon he the constable greatly outran.

Specifically—(a) In *math.*, a quantity which is assumed to be invariable throughout a given discussion; in the differential calculus, a quantity whose value remains fixed while others vary continuously. Although the constants do not vary by the variation of those quantities that are at first considered as variables, some or all of them may be conceived to vary in a second kind of change, called the *variation of constants*. A quantity which upon one supposition would remain constant becomes variable by the introduction of another supposition. Thus, taking into account the earth's attraction only, the longitude of the moon's node is constant, but by the attraction of the sun and planets its place is slowly changed. In this case one of the constants is said to *vary*. In algebra the unknown quantities are considered as *variables*, the known quantities and coefficients as *constants*. (b) In *physics*, a numerical quantity, fixed under uniform conditions, expressing the value of one of the physical properties of a certain substance. Thus, the *physical constants* of ice are the values of its specific gravity, melting-point, coefficient of expansion, index of refraction, electrical conductivity, etc. Similarly, in the case of a physical instrument a *constant* is a fixed value depending upon its dimensions, etc. Thus, the constant of a tangent galvanometer is the radius of its coil divided by the number of coils into 6.25318+.

The strength of a current may be determined in "absolute" units by the aid of the tangent galvanometer if the constants of the instrument are known.
S. P. Thompson, Elect. and Mag., p. 166.

See *arbitrary*.—**Circular constant.** See *circular*.—**Constant of aberration**, that one constant by the determination of which the aberration is obtained from its known laws at any given time.—**Constant of integration**, the new unknown constant which has to be introduced into every result of mathematical integration.—**Constants of color.** See *color*, 1.—**Gravitation constant**, the absolute modulus of gravitation, the acceleration per unit of time produced by the gravitating attraction of a unit mass at the unit of distance. The gravitation constant is about 6.0000000658 of a c. g. s. unit.—**Indeterminate constant**, a constant the value of which is unsettled, and which therefore differs from a variable only in not being regarded under that aspect.

Constantia (kɒn-stən'shi-ā), *n.* A wine (both red and white) produced in the district around the town of Constantia in Cape Colony, South Africa.

Constantinus*, Constantine); *πόλις*, city.] **I. a.** Relating or belonging to Constantinople, the present capital of Turkey, or to its inhabitants; produced in or derived from Constantinople.

It was natural that the Venetians, whose State lay upon the borders of the Greek Empire, and whose greatest commerce was with the Orient, should be influenced by the Constantinopolitan civilization.
Hovells, Venetian Life, xxi.

Constantinopolitan Council, one of the several church councils held at Constantinople. The most famous of these are three general or ecumenical councils, namely: the second general council, under Theodosius, in A. D. 381, which condemned Macedonianism, authorized the creed commonly called the Nicene, and gave honorary precedence to the see of Constantinople next after that of Rome; the fifth general council, under Justinian, in 553, which condemned the Nestorian writings known as "the Three Chapters," and the Origenists; and the sixth general council, under Constantine Pogonatus, 680, against Monothelism, celebrated for its condemnation of Pope Honorius. The Roman Catholics also regard as ecumenical the eighth council, held in 869. The council commonly known as the Quinisext, because regarded as complementary to the fifth and sixth councils, was held at Constantinople under Justinian II. in 691, in the trullus or domed banqueting-hall of the palace, from which it was also called the Trullan Council. Its canons are received by the Greek Church, and were confirmed by the second Nicene Council. A council held at Constantinople under Constantine Copronymus in 754, favoring the Iconoclasts, claimed to be ecumenical, but its decrees were reversed by the second Nicene Council in 787. See *council*, 7.—**Constantinopolitan creed.** See *Nicene*.—**Constantinopolitan liturgy.** See *liturgy*.

Coma Berenices (the Hair of Berenice) is an ancient asterism, which was not reckoned as a constellation by Ptolemy. Antinöus, mentioned by Ptolemy as part of the constellation Aquila, is said to have been made a separate constellation by Firmicus in the fourth century. Crux (the Crozier or Southern Cross) appears to be mentioned by Dante. The navigators of the sixteenth century added a number of southern constellations. Twelve of these appear in the important star-atlas of Bayer (A. D. 1603), namely: Apsis (the Bird of Paradise), Chameleon, Dorado (the Goldfish; or Xiphias, the Swordfish), Grus (the Crane), Hydrus (the Watersnake), Indus (the Indian Man), Musca or Apis (the Fly or the Bee), Pavo (the Peacock), Phoenix, Triangulum Australe (the Southern Triangle), the Toucan (also called Anser Americanus), and Volans (the Flying-fish). Columba (the Dove of Noah) was made by Petrus Plancius early in the sixteenth century. Bartschius in 1624 added several constellations, of which Camelopardalis (the Camelopard) and Monoceros (the Unicorn) are retained by modern astronomers. Hevelius in 1630 added Canes Venatici (the Greyhounds), Lacerta (the Lizard), Leo Minor (the Small Lion), Lynx (the Lynx), Scutum Sobieski (the Shield of Sobieski), Sextans (the Sextant), and Vulpecula et Anser (the Fox and the Goose). Flamly, Lacaille in 1752 added Antlia Pneumatica (the Air-pump), Caelum (the Graver), Circinus (the Compass), Fornax (the Furnace), Horologium (the Clock), Mons Mensæ (the Table-mountain), Microscopium (the Microscope), Norma (the Quadrant), Octans (the Octant), Equus Pictorius (the Painter's Easel), Retenulum (the Net), Sculptor, and Telescopium (the Telescope). The ancient constellation Argo was broken up by Lacaille into the Stern, the Keel, the Sail, and the Mast. There are, therefore, eighty-five constellations now recognized. The names of the constellations are mostly derived from Greek and Roman mythology. The practice of designating by the letters of the Greek alphabet (α, β, γ , etc.) the stars which compose each constellation, in order of their brilliancy, originated with Bayer.

Without a constitution—something to counteract the strong tendency of government to disorder and abuse, and to give stability to political institutions—there can be little progress or permanent improvement.

Calhoun, Works, I. 11.

A federal constitution is of the nature of a treaty. It is an agreement by which certain political communities, in themselves independent and sovereign, agree to surrender certain of the attributes of independence and sovereignty to a central authority, while others of these attributes they keep in their own hands.

E. A. Freeman, Amer. Lects., p. 190.

4. Constitutions (constitutions), properly speaking, are those Apostolic letters which ordain, in a permanent manner, something for the entire church or part of it.

H. B. Smith, Elem. Eccles. Law (5th ed.), I. 26.

Of the canons and constitutions made in these [English ecclesiastical] assemblies, many have come down to our own times. These form a kind of national canon law. . . . They are principally taken up in such matters as peculiarly belonged to the . . . consideration of a national assembly of the clergy.

Reeves, Hist. Eng. Law (Finlason, 1880), II. 340.

5. Any system of fundamental principles of action: as, the New Testament is the moral constitution of modern society.—*Apostolic Constitutions*. See *apostolic*.—*British Constitution*, a collective name for the principles of public policy on which the government of the United Kingdom of Great Britain and Ireland is based. It is not formulated in any particular document or set of documents, but is the gradual development of the political intelligence of the English people, as embodied in concessions forced from unwilling sovereigns, in the results of various revolutions, in numerous fundamental enactments of Parliament, and in the established principles of the common law. The character of the government has become increasingly democratic, and the power of the sovereign, great in the time of the Tudors, Stuarts, and earlier, is now much abridged. The controlling force in the movement has been the gradually acquired supremacy of Parliament (now residing almost entirely in the House of Commons) over the executive powers of government, so that the principal function of the sovereign is now that of simple confirmation. The chief monuments of the British Constitution, as a growth of liberal representative government, are the Magna Charta and its successive extensions, the Habeas Corpus Act, and the Bill of Rights, the principles of which have been incorporated in all the written constitutions of the English-speaking race. (See these terms.)—*Constitution coin*, a German coin struck according to the Leipsic rate of coinage, 8 rix-dollars weighing a Cologne mark of silver, 14 loths 4 grains fine, and 13½ florins weighing one mark, 12 loths fine. This rate, adopted by some states in 1690, was established throughout the empire from 1738 to 1763.—*Constitution of the United States, or Federal Constitution*, the fundamental or organic law of the United States. It was framed by the Constitutional Convention which met in Philadelphia May 25th, 1787, and adjourned September 17th, 1787, and it went into effect March 4th, 1789 (although Washington, the first president under it, was not inaugurated till April 30th), having been ratified by eleven of the thirteen States, the others, North Carolina and Rhode Island, ratifying it November 21st, 1789, and May 29th, 1790, respectively. It is a document comprised in seven original articles and fifteen amendatory articles, or amendments. Of the original articles, the first deals with the legislative body, prescribing the method of election to the House of Representatives and the Senate, the qualifications of members, the methods in which bills shall be passed, and those subjects on which Congress shall be qualified to act; the second relates to the executive department, prescribing the method of election and the qualifications and duties of the President; the third relates to the judicial department, providing for the supreme court and such inferior courts as Congress may think necessary; the fourth deals with the relations between the general government and the separate States, and provides for the admission of new

States; the fifth relates to the power and method of amendment to the Constitution; the sixth, to the national supremacy; and the seventh, to the establishment of the government upon the ratification of the Constitution by nine of the States. The amendments, according to one of the methods provided, were proposed by Congress and ratified by the States. The first twelve were submitted under acts passed in 1789–90, 1793, and 1803; the last three, after the civil war, under acts of 1865, 1868, and 1870. The most important of them are the twelfth, which changed the method of election of President and Vice-president; the thirteenth, which abolished slavery; the fourteenth, which disqualifies any one who has been engaged in rebellion against the government from holding office unless his disqualification be removed by Congress, and prevents the assumption and payment of any debt incurred in aid of rebellion; and the fifteenth, which prohibits the denial to any one of the right to vote because of race, color, or previous condition of servitude.—*Constitutions of Clarendon*, in *Eng. hist.*, certain propositions defining the limits of ecclesiastical and civil jurisdiction, drawn up at the Council of Clarendon, near Salisbury, held by Henry II., A. D. 1164.

2. Beneficial to, or designed to benefit, the physical constitution: as, a *constitutional walk*.—**3.** Forming a part of, authorized by, or consistent with the constitution or fundamental organic law of a nation or state. In English law the question whether an act is constitutional turns on its consistency with the spirit and usages of the national polity, and an innovation departing from that standard is not necessarily void. In the United States the question turns on consistency or conformity with the written constitution, and an act in contravention of that is void.

To improve establishments. . . by constitutional means.

Bp. Hurd, Sermon before the House of Lords.

As we cannot, without the risk of evils from which the imagination recoils, employ physical force as a check on misgovernment, it is evidently our wisdom to keep all the constitutional checks on misgovernment in the highest state of efficiency.

azione, < NL. *consubstantiatio* (n-), < *consubstantiare*: see *consubstantiate*, v.] The doctrine that the body and blood of Christ coexist in and with the elements of the eucharist, although the latter retain their nature as bread and wine; opposed to the Roman Catholic doctrine of *transubstantiation*. The term *consubstantiation* was employed in the doctrinal controversies of the Reformation by non-Lutheran writers, to designate the Lutheran view of the Saviour's presence in the Holy Supper. The Lutheran Church, however, has never used or accepted this term to express her view, but has always and repeatedly rejected it, and the meaning it conveys, in her official declarations.

They [the Lutherans] believe that the real body and blood of our Lord is united in a mysterious manner, through the consecration, with the bread and wine, and are received with and under them in the sacrament of the Lord's supper. This is called *consubstantiation*. Hooker.

They, therefore, err, who say that we believe in impanation, or that Christ is in the bread and wine. Nor are those correct who charge us with believing subpanation, that Christ is under the form of bread and wine. And equally groundless is the charge of *consubstantiation*, or the belief that the body and blood of Christ are changed into one substance with the bread and wine. . . . But the Lutheran Church maintains that the Saviour fulfils his promise, and is actually present, especially present in the Holy Supper in a manner not comprehensible to us and not defined in the Scriptures. If both surfaces have double points at the double point of the intersection, contact consists in having the same tangent plane and the same point of tangency.—**Contact of the *n*th order**, in *math.*, coincidence of *n* + 1 consecutive points

Infectious contact or communication; specifically and commonly, the communication of a disease from one person or brute to another. A distinction between *contagion* and *infection* is sometimes adopted, the former being limited to the transmission of disease by actual contact of the diseased part with a healthy absorbent or abraded surface, and the latter to transmission through the atmosphere by floating germs or miasmata. There are, however, cases of transmission which do not fall under either of these divisions, and there are some which fall under both. The disease [empusa] is *contagious*, because a healthy fly coming in contact with a diseased one, from which the spore-bearing filaments protrude, is pretty sure to carry off a spore or two. It is "infectious" because the spores become scattered about all sorts of matter in the neighbourhood of the slain flies. *Huxley, Lay Sermons*, p. 372.

The power of enforcing their process, and of vindicating their authority against open obstruction or defiance, is incident to all superior courts.

Actual contact; a touching; the state of being in contact, or within touching distance; hence, proximity of situation or place; contiguousness; adjacency.

Regard is justly had to *contiguity*, or adjacency, in private lands and possessions. *Bacon, Fable of Perseus.*

3. In *psychol.*, the coexistence or immediate sequence of two or more impressions or experiences. The *law of contiguity* is that law of mental association according to which an idea which has been accompanied or followed by another is more likely to be accompanied or followed by that other on any occasion of reproduction, and that this tendency is stronger the oftener and the closer the contiguity of the ideas has been. The law also includes the tendency of ideas to recall ideas that have immediately preceded them—if there is such an elementary tendency, which is disputed. *Contiguity* is the most characteristic of the principles of association. It was stated by Aristotle, and was revived by David Hume, who used the word *contiguity* to translate Aristotle's term *ἰσχυρῶς*.

The qualities from which this association arises, and by which the mind is after this manner convey'd from one idea to another, are three, viz.: Resemblance, *Contiguity* in time or place, and Cause and Effect.

3. In *phys. geog.*, one of the largest land-masses of the globe. From the most general point of view there are two continental masses, the eastern and the western, the old world and the new world. In breaking these up into lesser divisions, Europe and Asia together naturally constitute one mass, conveniently designated as Eurasia, though each is commonly reckoned a separate continent. Africa, formerly attached to Asia very slightly by the isthmus of Suez, and now artificially severed from it by the Suez canal, forms another continental mass. Australia is regarded by many as a third continental subdivision of the eastern land-mass (or a fourth, reckoning Europe and Asia separately). North and South America form the two great natural subdivi-

sions (also separately called continents) of the western continent, and are hardly more united than were Africa and Asia before the cutting of the Suez canal.

4. [*cap.*] In a special sense, in English literature, the mainland of Europe, as distinguished from the British islands: as, to travel on the *Continent*.

(b) Inclined to favor a strengthening of the general government and an increase of unity among the colonies.—**Continental climate**, in *phys. geog.*, the climate of a part of a continent, regarded as owing its peculiarities to this fact. Such a climate is subject to great fluctuations of temperature, both diurnal and seasonal. An insular climate, on the other hand, is much more equable. This difference is most marked in the case of a small island remote from all other land, as contrasted with the central portions of a great continental mass like Asia. Places near the sea, but more especially if surrounded by the sea, and in proportion as they are distant from the land, enjoy a more equable or insular climate. At a great distance from the sea, and especially if the land-area is very large, the summer is abnormally hot and the winter proportionally cold, while the difference between the temperatures of night and day is also very marked. The interiors of the continents have in general a smaller rainfall than their edges.—**Continental pronunciation, or system of pronunciation**, of Latin and Greek. See *pronunciation*.—**Continental system**, in *modern hist.*, the plan of the emperor Napoleon for excluding the merchandise of England from all parts of the continent of Europe. Such quantities are also said to be in continued proportion, and a series of continued proportionals is otherwise called a geometrical progression.—Continued voyage, or continuous voyage, a voyage presented to completion. In the law of prizes, a voyage of a vessel carrying contraband of war, or carrying goods intended for a blockaded port, although in fact ended by stopping short of the unlawful destina- tion and making a transhipment in order to evade the law, is treated by some courts as if continued, thus bringing upon the vessel and cargo the same liability as if it had continued the voyage and effected the unlawful purpose.

Fire will live in it [vapor of the grotto del Can] no longer than in water, because it wraps itself . . . about the flame, and by its continuity hinders . . . air and nitre from coming to its succour. Addison, Italy.

2. In math. and philos., a connection of points (or other elements) as intimate as that of the instants or points of an interval of time: thus, the continuity of space consists in this, that a point can move from any one position to any other so that at each instant it shall have a definite and distinct position in space. This state- ment is not, however, a proper definition of continuity, but only an exemplification drawn from time. The old definitions—the fact that adjacent parts have their limits in common (Aristotle), infinite divisibility (Kant), the fact that between any two points there is a third (which is true of the system of rational numbers)—are inadequate. The less satisfactory definition is that of G. Cantor, that continuity is the perfect concatenation of a system of points—words which must be understood in special senses. Cantor calls a system of points concatenated when any two of them being given, and also any finite distance, however small, it is always possible to find a finite number of other points of the system through which by successive steps, each less than the given distance, it would be possible to proceed from one of the given points to the other. He terms a system of points perfect when, whatever point not belonging to the system be given, it is possible to find a finite distance so small that there are not an infinite number of points of the system within that distance of the given point. As examples of a concatenated system not perfect, Cantor gives the rational and also the irrational numbers in any interval. As an example of a perfect system not concatenated, he gives all the numbers whose ex- pression in decimals, however far carried out, would contain no figures except 0 and 9.

The simplest of the Concrete Sciences, Astronomy and Geology, yield the idea of continuity with great distinct- ness. I do not mean continuity of existence merely; I mean continuity of causation: the unceasing production of effect—the never-ending work of every force.

In zool. and anat., that part of a thing which lies between the two ends, as the shaft of a long bone, or its diaphysis, as distinguished from its condyles or epiphyses, or the middle portion of the bill of a bird, as distinguished from the base and apex. [Chiefly an anatomical term, and especially a surgical one; as, the fracture of a bone in its continuity.]—Continuity of forms, in the Kantian philos., the doctrine that if A and B are two concepts such that A includes the whole content of B and more, there will always be a third concept C, such that A includes the whole content of C and more, while C includes the whole content of B and more.

—Equation of continuity, in hydrodynamics, the equa- tion which expresses that any change in the quantity of fluid within any closed surface is, in the absence of sources or sinks within the surface, due to the flow of fluid through the surface. In its differential form the equation is

$$\frac{dp}{dt} + \frac{dp_u}{dx} + \frac{dp_v}{dy} + \frac{dp_w}{dz} = 0,$$

where t is the time, ρ the density, x, y, z the rectangular coordinates, and u, v, w the corresponding components of the velocity.—Law of continuity, the doctrine that continuous changes in conditions will be accompanied by continuous changes in the results. This law was first set forth by Leibnitz in 1687, and employed to show that the properties of the parabola may be deduced from those of the ellipse, the laws of rest from those of motion, etc. Later he declared it applicable to such questions as whether there is an uninterrupted series of species from the highest to the lowest. The doctrine has often been understood as implying that there are no abrupt varia- tions in nature.

From the knowledge of the complete state at any instant of a thing whose motion obeys the law of continuity, we can calculate where it was at any past time, and where it will be at any future time. W. K. Clifford, Lectures, I. 122.

contour-line (kənt'ōr'lin), *n.* In *surv.*, a line joining points of equal elevation on a surface; a line or level carried along the surface of a country or district at a uniform height above the sea-level. When laid down or plotted on a map or plan, such lines show the elevations and depressions of the surface of the ground, the degree of accuracy depending on the number of lines or levels taken. In the maps of the Coast and Geodetic Survey of the United States the contour-lines are generally given for every 20 feet of elevation. It is essential to the completeness of a contour-line that it should be carried on till it returns to the point whence it started, thus describing a closed curve. The littoral cordon or outline of the sea forms a natural contour-line. The system of representing the form of the earth's surface by means of horizontal lines at equal vertical distances was probably invented by Philippe Buache in 1744.

Contour-lines, eighty feet apart vertically, were run; and intermediate forty-foot contours were interpolated by means of slope-measurements in the steeper parts, and by running curves in the more level portions.

Science, III, 365.

Contour-line map, a map in which the elevations are indicated by contour-lines, which may be drawn at any distance apart, according to the scale adopted and the accuracy with which the surveys have been made. Where the slope is steep the lines are more crowded together, and vice versa. This is, on the whole, the most advantageous method of representing topography where the scale adopted is large.

Woolsey, *Introd. to Inter. Law*, § 179.

Contraband goods, such goods as are prohibited to be imported or exported by the laws of a particular kingdom or state, or by the law of nations, or by special treaties. In time of war, arms and munitions of war, and such other articles as may directly aid belligerent operations (called *contraband of war*), are not permitted by one belligerent to be transported by neutrals to the other, but are under the law of nations held to be *contraband* and liable to capture and condemnation.

Contraband of war perhaps denoted at first that which a belligerent publicly prohibited the exportation of into his enemy's country, and now those kinds of goods which by the law of nations a neutral cannot send into either of the countries at war without wrong to the other, or which by conventional law the states making a treaty agree to put under this rubric.

Woolsey, *Introd. to Inter. Law*, § 178.

What I have said of the proportion of free colored persons to the whites in the District [of Columbia] is from the census of 1860, having no reference to persons called *contrabands*. *Lincoln*, in *Raymond*, p. 326.

Occasional contraband, goods treated as *contraband* by a belligerent, upon the pretext or justification that, though not ordinarily *contraband*, they are in effect such by reason of the peculiar circumstances of the occasion; doubtful articles put into the list of *contraband* by a belligerent merely because they are not the product of the exporting country, or because they are intended for a naval or military port, or for similar reasons.

The doctrine of *occasional contraband*, or *contraband* according to circumstances, is not sufficiently established to be regarded as a part of the law of nations.

5. Specifically, in law, an interchange of legal rights by agreement. (a) In the most general sense, any agreement or obligation whereby one party becomes bound to another, whether by record or judgment, or by assent, or even impliedly, to do or to omit to do an act. In this sense it is used in contradistinction to obligations arising out of torts or wrongs. (b) The legal obligation resulting from the drawing together of minds until they meet in an agreement for the doing or the not doing of an act. In its narrowest use in this sense it implies an agreement where both parties become bound. *Contracts* of this sort are sometimes called *bilateral*, to distinguish them from *unilateral* contracts, which bind but one party. (c) An agreement in which a party undertakes to do or not to do an act. In this sense it includes *unilateral contracts*, such as promissory notes. (d) In the most strict sense, an agreement enforceable by law; an agreement upon sufficient consideration, and in such form, and made under such circumstances, that a breach of it is a good cause of action. In this sense it includes the idea of validity, as distinguished from those contracts which lack some element necessary to constitute a legal obligation. (e) In *civil law*, as defined by modern authors, the union of two or more persons resulting in an accordant declaration of the will, with the object of creating a future obligation between them. In the *Pandects* the generic word was *conventio*, and the word *contractus* was used for those particular conventions which were accompanied by such formalities as to fall within one of the classes recognized by the law as binding; the other conventions, the recognition of which was of later growth, and which were of imperfect effect, were called *pacta*.—**Accessory contract, aleatory contract, bare contract, commutative contract, etc.** See the adjectives.—**Contract of record**, a contract made and entered of record before a judicial tribunal, as a judgment, recognizance, etc.—**Executed contract**, a contract in respect of which the thing agreed has been done; a contract by or under which the possession of and right to the chose or thing are transferred together, as a deed conveying land.—**Executory contract**, a contract in respect of which the thing agreed remains yet to be done, as a contract to convey land at a future day. A mutual contract (which see) may be *executed* as to one party, and remain *executory* as to the other.—**Express contract**, a contract in which the agreement is made in express words or by writing.—**Gambling contract**, a contract to pay at a certain future time an amount equal to any rise in the market price of any article of commerce, in consideration that the other party will pay the amount equal to any fall. *Bisbee and Simonds*.—**Implied contract**, a contract which the law imputes or raises by construction, by reason of some value or service rendered, and because common justice requires the party to be treated as if he had agreed: as, where one person receives the money of another, a *contract* to pay it over may be *implied*.—**Indeterminate contract**, a contract the terms of which cannot be fixed by all the parties acting for their true interests, because the circumstances are such that no agreement (nor acquiescence in a non-agreement) can be reached until other motives act.—**Innominate contracts**. See *nominate contracts*, below.—**Joint contract**, a contract in which the contractors are jointly bound to perform the promise or obligation therein contained, or entitled to receive the benefit of such promise or obligation. *Bouvier*.—**Literal contract**, in *Rom. law*, an agreement the validity of which was recognized by the tribunals provided the agreement was entered in the account-book of one, or it may have been of both, of the parties.—**Maritime contract**. the vendor must give evidence of his title.—**Oral contract.** Same as *verbal contract*.—**Parole or simple contract,** a contract not by specialty or under seal, whether in writing or by word of mouth. *Stephen*.—**Real contract,** in *Rom. law*, an agreement the validity of which was recognized by the courts because it related to a thing, and the thing had been delivered pursuant to it.—**Social contract** [*F. contrat social*], a supposed expressed or implied agreement regulating the relations of citizens with one another and with the government, and forming the foundation of political society: the phrase used as a title to a treatise on government by J. J. Rousseau, which exercised a great influence in France and elsewhere previous to the revolution.—**Special contract.** (a) A sealed contract. (b) A written contract specifying in detail what is to be done, as a building-contract with specifications.—**To count on contract.** See *count*.—**Verbal contract,** a contract made by word of mouth, in contradistinction to one embodied in writing. The stimulus normally comes through the nerves, and may be accompanied by volition or not; but it may also be applied artificially, either indirectly through the nerves or directly to the muscle itself, as by electricity, mechanical violence, or chemical action.

It is not pure thought which moves a muscle; neither is it the abstraction *contractility*, but the muscle, which moves a limb.

The act of drawing together or shrinking; the condition of becoming smaller in extent or dimensions through the nearer approach to one another of the parts; the state of being contracted; a decrease in volume, bulk, or dimensions, as from loss of heat. All bodies, with very few exceptions, expand by the application of heat, and contract when heat is withdrawn. (See *expansion* and *heat*.) Contraction also takes place when a gas is condensed to a liquid, and in most cases when a liquid is changed to a solid; there are, however, some exceptions, as water, which expands on solidifying.

Contraction of the pupil takes place not only under the stimulus of light, but also in looking at very near objects. The reason of this is, that correction of spherical aberration is thus made more perfect.

Specifically—3. A shortening of a word in pronunciation or in writing: as, can't is a *contraction* of cannot. In writing, contraction takes place, as in pronunciation, primarily by the omission of intermediate letters; but also by writing in a smaller character the last letter above the word contracted, by running two or more letters into one character, by using symbols representing syllables or words, and by the use of initial letters: as, *recd.* for *received*; *q'm* for *quam*; & for *et*. Specifically, in *Gr. gram.*, the union of the concurrent vowels of two syllables into one long vowel or diphthong—that is, of *ow* into *o*, of *ee* into *e*, etc. See *abbreviation*, 2.

Thus, in the dactylic hexameter, a spondee (—) can be substituted in the first four feet for a dactyl (— ∪ ∪), one long being metrically equivalent to two shorts; but such a substitution is admissible only in certain kinds of verse and in certain parts of a foot or line, according to special rules. In the dactylic hexameter, for example, the fifth foot must ordinarily be a dactyl, not a spondee. The converse of *contraction* is *resolution*.

Contradiction in terms, a self-contradictory phrase, as "a square circle."—**Principle of contradiction**, the principle that nothing can be both true and false in the same sense and in the same respects. Modern formal logic demonstrates that this principle enters into a large part of our reasoning, but forms the hinge only of a few very simple inferences (not of direct syllogism). Accordingly, it is often referred to as such without regard to its exact signification. The law was enunciated by Aristotle, but its name was perhaps first given to it by Kamus.

The proposition that no subject can have a predicate which contradicts it is called the *principle of contradiction*. It is a general though negative criterion of all truth.

convection (kon-vek'shon), *n.* [LL. *convectio*(*n*), < L. *convectere*, pp. *convectus*, carry together, convey, < *com-*, together, + *vehere*, carry: see *vehicle*.] The act of carrying or conveying; specifically, the transference of heat or electricity through the change of position of the heated or electrified body: distinguished from *conduction* (which see). When a portion of a liquid or a gas is heated above the temperature of surrounding portions, it increases in volume, and, thus becoming specifically lighter, rises, while the cooler portions of the fluid rush in from the sides and descend from the upper parts of the vessel. *Convection currents* are thus produced, and the liquid or gas is soon heated throughout. This principle is used in heating a house by a hot-air furnace. The Gulf Stream is a grand *convection current*, carrying the heat of the equator toward the pole. (See *heat*.) Similarly, electricity may be transmitted by convection by the mo-

tion of the electrified body itself, as when the electricity of a conductor is discharged by a point, it being carried off by a stream of electrified air-particles.

The term *convection* is applied to those processes by which the diffusion of heat is rendered more rapid by the motion of the hot substance from one place to another, though the ultimate transfer of heat may still take place by conduction. *Clerk Maxwell*, Heat, p. 10.

II. *n.* 1. A part answering or corresponding to another, but differing from it in nature and required to make it complete; a complement; a counterpart: as, the hollows in a mold in which a medal has been cast are the converse of the parts of the medal in relief. [*Converse* is often used incorrectly in the sense of *reverse*—that is, the opposite, the contrary.

2. (*b*) One of a pair of propositions having the same subject and predicate or antecedent and consequent, but in the reversed order. Thus, the proposition that every isosceles triangle has two of its angles equal is the converse of the proposition that every triangle having two angles equal is isosceles. See *conversion*, 2.

The given proposition is called the converted or converse; the other, into which it is converted, the converting. There is, however, much ambiguity, to say the least of it, in the terms commonly employed by logicians to designate the two propositions—that given, and the product of the logical elaboration.
Sir W. Hamilton, Logic, xiv.

conversion (kon'vèr'shon), *n.* [= *F. conversion* = *Pr. conversio* = *Sp. conversión* = *Pg. conversão* = *It. conversione*, *< L. conversio(n)-, < convertere*, pp. *conversus*, convert: see *convert*, *v.*] 1. In general, a turning or changing from one state or form to another; transmutation; transformation: sometimes implying total loss of identity: as, a conversion of water into ice, or of food into chyle or blood; the conversion of a thing from its original purpose to another; the conversion of land into money.

The conversion of arable land into pasture, which was the chief agrarian grievance, was much more universal among Catholics than among Protestants.

Specifically—2. In *logic*, that immediate inference which transforms a proposition into another whose subject-term is the predicate-term, and whose predicate-term is the subject-term of the former. *Simple, proper, or direct conversion* is that in which the quantity and quality of the propositions remain unchanged: as, No good man is unhappy; hence (by conversion), No unhappy man is good. *Conversion per accidens* (by accident) is that in which the quality of the first proposition is unchanged while its quantity is changed: as, All cockatrices are non-existent; hence (by conversion), Some non-existent things are cockatrices. *Conversion by contraposition* is where the quantity and quality are preserved, but the terms are infinitated: as, Some Chinamen are not honest; hence, Some non-honest persons are not Chinamen. The traditional rules of conversion are embodied in the verse,

Simpliçiter facti, convertitur eua per accl,
Astro per contra, sicut conversio tota,

where the vowels of *facti, eua, astro*, show the kinds of propositions which can be converted in the three ways. (See A1, 2 (b)). A *diminutive conversion* is a conversion of a proposition such that the consequent asserts less than the antecedent: as, All lawyers are honest, and therefore some honest men are lawyers. An *improper or reductive conversion* is a conversion per accidens or by contraposition. A *universal conversion* is an inference by conversion whose conclusion is a universal proposition; a *partial conversion*, one whose conclusion is a particular proposition. [The Latin *conversio* was first used in this sense by Appuleius to translate Aristotle's ἀντιστροφή.]

W. B. Carpenter, Micros., § 31.

Conversion of St. Paul, a festival of the Roman Catholic and of the Anglican Church, observed on the 25th of January, in commemoration of the conversion of St. Paul the Apostle, as related in the ninth chapter of Acts.—**Syn. 3. Conversion, Regeneration.** *Conversion* is generally employed to express the voluntary act of the individual in turning from sin to seek the pardon and grace of God, while *regeneration* is employed to express the divine act exerted by the Spirit of God on the soul of man. But this distinction is by no means always observed even in theological writings, and the two terms are often used synonymously.

3. In monasteries, a lay friar or brother admitted to the service of the house, without orders, and not allowed to sing in the choir.—Clinical convert. See clinical. = Syn. 1. Neophyte, Convert, Proselyte, Pervert, Apostate, Renegade. A neophyte is a convert who is still very new to the doctrine or duties of his religion; hence, figuratively, the word stands for a novice in any line; it does not at all suggest the abandonment of any other faith for the present one. A convert may or may not be from some other faith; the word expresses a radical change in convictions, feelings, purposes, and actions, and therefore suggests the sincerity of the subject; it is rarely used with a sinister meaning, but it may mean only acquiescence in a new faith proposed for nominal adherence: as, they were offered the choice of death or becoming converts to the faith of the conqueror. A proselyte is generally from some other faith or alliance, primarily in religion, but also in partizanship of any kind: proselytism does not necessarily imply conviction; the tendency is to use only convert in the good sense, and apply proselyte to one brought over by unworthy motives, and proselytizer to one who seeks recruits for his faith without being particular as to their being converted to it. Pervert as a noun is new, and confined chiefly to England; it is a paronomasia for convert, and a controversial word, stigmatizing one who abandons the Church of England, or one of the other Protestant churches, for the Roman Catholic Church. Apostate is a strong term for an utter, conspicuous, and presumably base renouncer of the Christian religion, or of any denominational, political, or other faith and affiliation. A renegade is one who, presumably without conversion of mind or heart, and from sheer interest, goes over from one faith or party to another; hence, a mere runaway or deserter. The term covers as much abhorrence and reprobat

3. [*cap.*] An assembly of the clergy of the Church of England for the settlement of certain ecclesiastical affairs. There are two *Convocations*, viz. of the provinces of Canterbury and York, summoned by writs from the crown to the archbishops. Each body contains an upper house of bishops with the archbishop as president, and a lower house, composed of deans, archdeacons, and elected proctors. Constitutions for both *Convocations* were established in the thirteenth century; later an unsuccessful attempt was made to incorporate them with Parliament. In 1533, by the Act of Submission, their legislative powers were restricted, and their acts have since been dependent upon special warrant from the crown. The *Convocation* of Canterbury was the more important and regular; but after its prorogation in 1717, although its meetings were continued for a time, it received no new royal warrant till 1861. The *Convocation* of York has generally been less regular in its proceedings than that of Canterbury. Both *Convocations* now meet at each parliamentary session, and the proctors are renewed at each parliamentary election.

2. In math., a magnitude belonging to a system of magnitudes serving to define the positions of points, lines, planes, or other spatial elements, by reference to a fixed figure; hence, also, a magnitude of a system serving to define the elements of a continuum, in general, as geometrical coördinates do positions in space; thus, the latitude, the longitude, and the height above the mean sea-level are the three coördi-

nates commonly used to define the position of a meteorological station. See *Cartesian*.

Moreover, our various bodily movements and their combinations constitute a network of co-ordinates, qualitatively distinguishable, but geometrically, so to put it, both redundant and incomplete. *J. Ward, Encyc. Brit., XX. 53.*

Areal coördinates, a special variety of trilinear coördinates, consisting of the areas of the three triangles having the variable point for a common vertex, and the other vertices two of the three fundamental points. These areas are taken as affected by such algebraical signs as to sum up to the area of the fundamental triangle.—**Axes of coördinates**. See *axis*.—**Barycentric coördinates**. See *triangular coördinates*, below.—**Biangular coördinates**, the two angles PAB and PBA, where P is a variable point in a plane, while A and B are fixed points. Sometimes the cotangents of these angles are taken as the coördinates.—**Bicircular coördinates**, two quantities serving to define the position of any point in a plane by reference to two series of circles which cut one another under a constant angle. There are two principal kinds of bicircular coördinates. In the first kind, a point having been assumed whose coördinates are to be infinite, two lines are drawn through it (commonly at right angles), and all the coördinate circles have their centers on these lines and pass through their intersection. One circle of each of these series passes through the variable point. If *a* is the distance from the point of infinite coördinates at which either of these circles passes through the line of centers of the circles of the same series, the corresponding coördinate is $A + 1/a$, where *A* is a constant belonging to this coördinate. In the second kind two fixed points, A and B, are assumed. Then, every circle of one series passes through both the points A and B, while each of the second series has its center on the line AB, and cuts all of the first series orthogonally. One coördinate is the angle at A between the line AB and the circle of the first series passing through the variable point, while the second coördinate is $P + \log(1/s + 1/S)$, where *s* is the distance from A to the point at which the circle of the second series passing through the variable point cuts the line AB, *S* is the distance AB, and *P* and *Q* are arbitrary constants.—**Bilinear coördinates**. (a) Same as *vectorial coördinates*. See below. (b) *Cartesian coördinates*, or *tangential coördinates* based on Cartesian coördinates.—**Binary coördinates**, non-homogeneous coördinates of points or lines in a plane.—**Bipunctual coördinates**, coördinates fixing the positions of points or lines in a plane by reference to two fixed points and a fixed direction of measurement. Bipunctual coördinates are of two kinds, line coördinates and point coördinates. Bipunctual line coördinates are the distances of a variable line from two fixed points measured in a constant direction. Bipunctual point coördinates are, each, the negative of the reciprocal of the distance measured in a fixed direction (the same for both coördinates) from one of two fixed points of the line joining the variable point to the other fixed point. In the figure, S and T being the two fixed points, SM and TN are the coördinates of the line MN, and the negatives of their reciprocals are the coördinates of the point P, the intersection of MT and SN.—**Boothian coördinates** (named after their inventor, the English mathematician James Booth), rectangular tangential coördinates. See *tangential coördinates*, below.—**Cartesian coördinates**. See *Cartesian*.—**Curve coördinates**, coördinates defining curves.—**Curvilinear coördinates**, quantities used to define the positions of points on a given curved surface.—**Elliptic coördinates**, a system of coördinates for defining curves upon an ellipsoid by means of the intersections of two systems of conical hyperboloids.—**Generalized coördinates**, in *analytical mech.*, any system of quantities serving to define the positions of the particles of a system, and treated in a general manner without specifying what they are.—**Homogeneous coördinates**, a system containing one coördinate more than is sufficient for defining the spatial element. One fixed non-homogeneous equation subsists between the coördinates, and every other equation between them is taken as homogeneous.—**Ignorance of coördinates**, the leaving out of account of some of the coördinates of a complicated mechanical system: an omission which is permissible under certain circumstances. Thus, in the kinetical theory of gases the coördinates of the individual molecules are not considered.—**Isothermal coördinates**, any pair of quantities serving to define the positions of points in a plane by means of two series of curves cutting one another at right angles.—**Line coördinates**, a homogeneous system of six coördinates fixing the position of a variable line in space.—**Oblique system of coördinates**, in *analytical geom.*, a system in which the coördinate axes are oblique to each other.—**Origin of coördinates**, a point whose coördinates are equal to zero; the intersection of the axes of coördinates.—**Orthotomic coördinates**, a system of three quantities determining the positions of points in space by reference to three series of surfaces cutting one another orthogonally.—**Point or punctual coördinates**, such coördinates as determine the positions of points.—**Polar coördinates in a plane**, a system of coördinates consisting of a radius vector, or the length of a line from the variable point to be defined to a fixed point termed the *origin*, and a vectorial angle, or angle between the radius vector and a fixed line through the origin, called the *initial line*, or *polar axis*.—**Polar coördinates in space**, a system of coördinates consisting of a radius vector, a plane vectorial angle, and a dihedral angle. A radius vector and three direction-cosines used to determine the position of points in space are also sometimes called polar coördinates.—**Quadrilinear coördinates**, homogeneous point coördinates in space defining a variable point by its distances from four fixed planes, these distances being measured in fixed directions.—**Rectangular coördinates**, a system of quantities serving to determine positions by a reference

to two axes in a plane, or three in space, which cut one another at right angles.—**Rodrigues's coördinates**, a certain system of quantities serving to define the position of a rigid body which has one point fixed. Such a body can be brought from any assumed position to any possible position by means of a rotation round an axis through the fixed point. Three of Rodrigues's coördinates are the direction-cosines of this axis, and the fourth is the angle of rotation.—**Spherical coördinates**, quantities analogous to latitude and longitude, used to determine the positions of points on a given sphere.—**Tangential coördinates**, coördinates defining the positions of lines in a plane or of planes in space.—**Tetrahedral coördinates**, or **barycentric coördinates in space**, quadriplanar coördinates whose fixed equation is

$$x + y + z + w = T,$$

x, y, z, w being the coördinates.—**Triangular or barycentric coördinates**, trilinear coördinates the fixed equation of which is

$$x + y + z = T,$$

where *x, y, z* are the coördinates.—**Trilinear coördinates**, a system of homogeneous coördinates defining the positions of points in a plane in which the fixed figure of reference is a triangle, called the fundamental triangle or triangle of reference, and the coördinates are the distances of the variable point from the sides of this triangle measured in three fixed directions.—**Vectorial coördinates**, the distances of a variable point in a plane from two fixed points. Also *bilinear coördinates*.

Some of the softer kinds are also called *anime*. Copal may be dissolved by digestion in linseed-oil, with a heat a little less than sufficient to boil or decompose the oil. This solution diluted with spirit of turpentine forms a beautiful transparent varnish, which, when properly applied and slowly dried, is exceedingly durable and hard. There are various methods of preparing it. The most highly prized copal is that obtained from Zanzibar and Mozambique, the product of leguminous trees, *Trachylobium Hornemannianum* and *T. As distinguished from the chasuble, the cope is a processional or choral vestment, while the chasuble is sacrificial or eucharistic. In the Church of England the cope was sometimes used instead of the chasuble, and at the time of the Reformation the chasuble itself was often called a cope. The 24th canon of 1603 (still in force) orders the cope to be worn by the celebrant in all cathedral and collegiate churches. It continued to be worn at the altar and at other times till the middle of the eighteenth century, especially in cathedrals, but had fallen gradually more and more into disuse till revived in recent times. A decision of the judicial committee of the Privy Council in 1871 limited its use to that enjoined in the canon of 1603. In England in the middle ages a long open black mantle sewn together in front over the neck and chest was worn by canons, and called the *canon's cope*. See *mandyas* and *pluvial*.

The Gr. name was *χαλκός*: see *chalchitis*, etc.] I. *n.* 1. Chemical symbol, Cu; atomic weight, 63.6. A metal distinguished from all others by its peculiar red color. Its crystalline form is that of the cube or regular octahedron (isometric). Its specific gravity is nearly nine times that of water (8.835 native copper, 8.953 electrolyte copper). Among the metals in common use, it stands next to gold and silver in malleability and ductility, and next to iron and steel in tenacity. Its melting-point is a little below that of gold and considerably above that of silver. Copper is one of the most widely diffused metals, and occurs in the native state, as well as in a great variety of sulphured and oxidized combinations. Native copper is not unfrequently met with in the superficial portions of cupriferous lodes, but usually only in small amount. In two regions, however, this metal is mined exclusively in the native state: namely, the south shore of Lake Superior, and Corooco in Bolivia; but of the two the former is by far the more important, and produces about one sixth of the total yield of the world. In the Lake Superior region the copper occurs in regular fissure-veins, and also in a conglomerate of volcanic origin, forming the cement by which the pebbles are held together. In the fissure-veins large masses of native copper have frequently been found, one such mass weighing over three hundred tons. Most of the copper of the world, previous to the opening of this region, was produced from ores consisting of combinations of the metal with certain mineralizers, such as sulphur and oxygen, and especially sulphur. The most abundant ore is the so-called "yellow copper ore" or copper pyrites, the chalcopyrite of the mineralogist, which is composed of copper, iron, and sulphur, and contains, when chemically pure, 34.6 per cent. of copper. The estimated total copper-production of the world for the year 1897 was 412,950 tons; and that of the United States, 227,703 tons. The copper of the United States comes chiefly from Lake Superior, Arizona, and Montana. Spain, Chile, Prussia, and Australia are other large producers of this metal. Copper has been known from the remotest ages, and was mined extensively on Lake Superior before the advent of Europeans. Its uses are manifold. The most important of them was, before the very general use of iron in ship-building, as a sheathing metal, first by itself, and later as a part of the alloy called *yellow metal*, a variety of brass. On account of its electric conductivity, copper is largely used for induction-coils and all kinds of electrical apparatus, and for the cores of telegraph-cables. For these uses very pure copper is required; a slight admixture of iron greatly increases its electrical resistance. For domestic purposes copper is made up in a great variety of forms, either by itself, or tinned in order to prevent corrosion by acid liquids. The electrotyping process depends on the deposition by the galvanic current of pure copper from a solution of one of its salts, the metal deposited forming an exact reproduction in copper of an object appended for that purpose in the bath. The alloys of copper are of great importance, and one of them, bronze, is of high antiquity. The salts of copper are also numerous, and are invaluable in the arts. Copper sulphate, or blue vitriol, is largely used in calico-printing, in electro-metallurgy, and in the preparation of the copper pigments Scheele's green, Schweinfurt green, and Paris green, the latter being much used as an insecticide, principally for the Colorado potato-beetle. See *brass*, *bronze*, and *yellow metal* (under *metal*).

In England, a tenure of lands of a manor, according to the custom of the manor, and by copy of court-roll; or a tenure for which the tenant has nothing to show except the rolls made by the steward of the lord's court, which contain entries of the admission of the original or former tenant, his surrender to the use of another, or alienation, or his death, and the claim and admission of the heir or devisee. There are two sorts of copyhold: the first is styled *ancient demesne*, or a customary freehold; and the second a *base tenure*, or mere copyhold. Copyhold property cannot be now created, for the foundation on which it rests is that the property has been possessed time out of mind by copy of court-roll, and that the tenements are with the manor. Copyholds now descend to the heir at law, according to the rules that regulate the descent of all other kinds of estate in land.

II. n. The coracobrachialis.

coracobrachialis (kor'a-kō-brak-i-ā'lis), *a.* used as *n.*; pl. *coracobrachiales* (-lēz). [*NL.*; *Coracoides*, coracoid, + *L. brachium*, arm: see *coracoid* and *brachial*.] A muscle which arises from the coracoid in common with the long head of the biceps, and is inserted into the shaft of the humerus. Same as *II.*—**Coracoid fontanelle**, a space or vacuity between or among several coracoid elements, as in batrachians.—**Coracoid process**, the coracoid of a mammal above a monotreme.

II. n. The distal or ventral element of the scapular arch, extending from the scapula to or toward the sternum, of whatever size, shape, or position: so named from the fact that in adult man it somewhat resembles the beak of a crow in size and shape. See cut under *scapula*. In reptiles, birds, and monotrematous mammals the coracoid is a comparatively large, distinct, and independent bone, articulated at one end with the shoulder-blade and at the other with the sternum. (See cuts under *hypocleidum* and *pectoral*.) In all mammals above the monotremes it is much reduced, becoming a mere process of the scapula, firmly ankylosed therewith and having no connection with the sternum, but normally having an independent center of ossification. In amphibians the coracoid varies in condition and relations, but when present conforms to the above definition. In batrachians the coracoid is divided by a large membranous space or fontanel into a coracoid proper, which lies behind this space, a persistently cartilaginous epicoracoid, which bounds the space internally, and a precoracoid in front of it. In fishes the term *coracoid* has been applied to several different parts, on the assumption of their homology with the coracoid of the higher vertebrates (see cut under *scapulocoracoid*): (a) by Ouvier and his followers, to the teleostemporal; (b) by Owen and others, to the precapula; (c) by Parker and other late writers, to the hypocoracoid; (d) by Gill, to the inner cartilage of the scapular arch and the bone into which it is disintegrated in the higher fishes. See these names, and also *ectocoracoid*, *epicoracoid*, *hypercoracoid*, *precoracoid*, *procoracoid*.

It corresponds to the Linnean *Passeres* or the Cuvierian *Passerina* divested of certain non-conformable types, to the *Volucres* of Sundevall, and to the *Passeres* of most modern authors. It is an immense assemblage, containing a majority of all birds. They exhibit the typical passerine structure, or the "crow form." Their technical characters are: an agithognathous palate; no basipterygoid processes; a forked manubrium sterni; the sternum single-notched behind and with short costiferous extent (with few exceptions); usually a hypochondrium; an accessory scapulohumeral bone; a mobile insistent hallux directed backward; a normal ratio of digital phalanges (2, 3, 4, 5); one carotid, the left; a syrinx presenting every degree of complexity; a nude oil-gland; and after-shafted plumage. See *foramen*.

ducing zoöphytes are usually compound animals, young buds sprouting from the body of the parent polyp and remaining connected with it on the same spot even after it is dead; so that a piece of coral may be regarded as the abode either of one compound animal or of a multitude of individuals. corban (kōr'ban), *n.* [Heb. *korbān*, an offering, sacrifice, < *karab*, approach, bring, offer. Cf. *corbana*.] 1. In *Judaism*, an offering of any sort to God, particularly in fulfillment of a vow. To the rules laid down in Lev. xvii. and Num. xxx. concerning vows, the rabbins added the rule that a man might interdict himself by vow not only from using for himself any particular object, for example food, but also from giving or receiving it. The thing thus interdicted was considered as corban. A person might thus release himself from any inconvenient obligation under plea of corban—a practice which Christ reprehended, as annulling the spirit of the law.

But ye say, If a man shall say to his father or mother, It is *Corban*, that is to say, a gift, by whatsoever thou mightest be profited by me; he shall be free. *Mark* vii. 11.

Origen's account of the *corban* system is that children sometimes refused assistance to parents on the ground that they had already contributed to the poor fund, from which they alleged their parents might be relieved. *W. Smith, Bible Dict.*

Compare *brass*, s.—**Corinthian bronze**, an alloy produced at Corinth, famous in antiquity, especially among the Romans, for its excellent quality and the artistic character and technical perfection of the utensils and art-objects made of it.—**Corinthian helmet**, the origin of which was attributed to Corinth, though its use was by no means peculiar to that city. It had cheek-pieces continuous with the back, extending beneath the chin, and separated in front by a narrow opening in part closed by a nasal and extending to the eye-holes. The convex upper portion projected beyond the lower portion, and commonly bore the long upright crest of the usual form. When the wearer was nnt in action the helmet was pushed back on the head for greater comfort, the cheek-pieces resting on the forehead.—**Corinthian order**, in *arch.*, the most ornate of the classical orders, and the most slender in its proportions. The capital is shaped like a bell, adorned with rows of acanthus-leaves, and less commonly with leaves of other plants. The usual form of abacus is concave on each of its sides, the projecting angles being supported by graceful shoots of acanthus, forming volutes which spring from *caules* or stalks originating among the foliage covering the lower part of the capital. These *caules* also give rise to lesser stalks or *caulices*, and to the spirals called *helices*, turned toward the middle, and supporting an anthemion or other ornament in the middle of each side of the abacus. In the best Greek example the shaft is fluted like the Ionic, and the base called *Attic* is usual. The entablature also resembles the Ionic. The Corinthian order is of very early origin, though it did not come into favor among the Greeks until comparatively late. The legend of the evolution of the Corinthian capital by Callimachus, in the fifth century B. C., from a calathus (woman's basket) placed on a maiden's tomb and covered with a tile, about which the leaves of a plant of acanthus had grown, is a fable. Among notable Greek examples of the order are the Tholos of Polyclitus at Epidaurus (fifth century B. C.), the choragic monument of Lyciscrates at Athens (335–4 B. C.), and the temple of the Olympian Zeus at Athens, finished by the Romans, who, as well as their followers of the Renaissance, used it freely, and modified it in accordance with their taste.—**Corinthian pottery**, Corinthian ware. A halo; specifically, in *astron.*, a halo or luminous circle around one of the heavenly bodies; especially, the portion of the aureola observed during total eclipses of the sun which lies outside the chromosphere, or region of colored prominences.

In every illuminated manuscript of the Anglo-Saxon period, each figure of a saint we behold with a circle of glory round the head. For such a disk of golden brightness, "nimbus" is the modern, *corona* the olden name.

In the larger and richer examples, however, the general disposition only is circular, this form being broken by lobes, cusps, and the like, along which the lights are arranged. The bounding line is usually marked by a broad band of metal, ornamented with repoussé work, enamel, etc., and having sacred texts inscribed upon it; to this band the separate candlesticks are attached. Also called *corona*.—**Corona nuptialis**, a nuptial crown; a crown placed upon the head of a bride or groom at the time of the marriage ceremony. At different periods in the history of Europe coronation has been essential to entrance upon kingly dignity and power; but where the order of succession is perfectly established, the authority of the new sovereign is considered as beginning with the death of his predecessor, and the coronation is only a ceremonial consecration.

This ceremony is mentioned by St. Chrysostom and other early Christian writers.

In the higher forms of Sycos the radial tubes no longer arise as simple outgrowths of the whole sponge-wall, but rather as outgrowths of the endoderm into the mesoderm, which, together with the ectoderm, exhibits an independent growth of its own; and this results in the formation of a thick investment, known as the *cortex*.

See *epilepsy*.—**Cortical layer**, in lichens, a multiple layer of cells forming a false parenchyma at the surface of the thallus, inclosing and protecting the less dense structure within. In horizontal frondose lichens there is an upper and a lower cortical layer. In some fungi a denser and firmer tissue at the surface is so called. The latter is also called the *pellicle* or *cutis*.—**Cortical paralysis**, paralysis due to a lesion of the cortex of the brain.—**Cortical sheath**, in *bot.*, a phrase applied by Nägeli to the whole of the primary bast-bundles. See *bast*.—**Cortical substance** of cells and unicellular animals, ectoplasm; outer cell-substance; the thicker, tougher, and less granular protoplasm upon the exterior of a cell, as distinguished from the *medullary substance*. Cotter tenure or system, a tenure of land by which a laborer rents a portion of land directly from the owner, and the conditions of the contract, especially the amount of rent to be paid, are determined not by custom, but by competition. This system was at one time especially characteristic of Ireland, and is not yet entirely extinct there. The tenancy was annual, and the privilege of occupancy was put up at auction, the consequence being excessive competition and exorbitant rents, since the cotter was obliged to get the land at any price in order to live. In an act passed in 1860 to consolidate and amend the law of landlord and tenant in Ireland, cotter tenancies are defined to be cottages with not more than half an acre of land, rented by the month at not more than £5 a year.

The white fibrous substance clothing the seeds of the cotton-plant (*Gossypium*). See cut under *cotton-plant*. It consists of simple delicate tubular hair-like cells, flattened and somewhat twisted. Its commercial value depends upon the length and tenacity of the fiber. It is the clothing material of a large proportion of the human race, its use dating back to a very early period. In commercial importance cotton exceeds all other staples. Great Britain ranks first in the consumption of the raw material, the United States being second, and then France. Cotton consists of nearly pure cellulose, and when acted upon by nitric acid yields a nitro-compound known as gun-cotton, which is a powerful explosive, and when dissolved in ether and alcohol forms collodion. Cotton is very extensively used in the manufacture of thread, and for many purposes in the arts. In surgery it is employed for many purposes, and especially as a dressing for burns, scalds, etc. See *cotton-plant*, *Gossypium*.

Modern inventions facilitating its manufacture by machinery have built up an immense industry in Europe and the United States. See *cotton-gin*, *spinning-jenny*.

Cotton-gin.

In this the fiber rests upon or against a grid, into the openings of which project the teeth of a gang of saws mounted upon a revolving mandrel. The teeth of the saws catch the fibers and draw them away from the seeds. The latter, being too large to pass through the openings, roll downward and out of the machine. The fibers, removed from the saws by a revolving brush, pass between rollers, and are delivered from the machine in the form of a lap. Other and similar machines have projecting needles, or hooked or covered wire teeth, instead of saws. In the *roller-gin* the fibers are drawn between rollers guarded by blades which prevent the passage of the seeds. cotton of commerce are: *G. Barbadosense*, known as sea-island cotton, with a fine, soft, silky staple nearly two inches long; *G. herbaceum*, yielding the upland or short-staple cotton of the United States; and *G. arboreum*. Nankin cotton is a naturally colored variety. Cotton-seed, after the removal of the fiber, yields upon pressure a large amount of yellow oil, with a bland, nut-like taste, closely resembling olive-oil, as a substitute or adulterant for which it is largely used. The residue after the extraction of the oil, called *cotton-cake*, is valuable as food for cattle and as a manure. 7. In *eccl. hist.*: (a) An assembly of prelates and theologians convened for the purpose of regulating matters of doctrine and discipline in the church. Ecclesiastical councils are *diocesan*, *provincial*, *national*, *general*, or *ecumenical*. A diocesan council is composed of the ecclesiastics of a particular diocese, with the bishop at their head; a provincial or metropolitan council, of the bishops of an ecclesiastical province, with the archbishops at their head; and a national or plenary council, of the bishops and archbishops of all the provinces in the nation. *General council* and *ecumenical council* are ordinarily regarded as equivalent terms, but strictly speaking a general council is one called together by an invitation addressed to the church at large, and claiming to speak in the name of the whole church. Such a council is ecumenical only if received by the Catholic Church in general. None of the general councils most widely accepted as ecumenical consisted of even a majority of orthodox bishops present in person or by deputy. The subsequent consent of the church at large marked them as ecumenical, especially their reception by the next general council held after the first violence of controversy had somewhat abated and opposition had become local in character. Both emperors and popes have summoned general councils. According to Roman Catholic teaching, a council to be regarded as ecumenical must have been called together by the pope, or at least with his consent, and its decrees must be confirmed by the pope. There are seven ecumenical councils recognized as such by both the Greek and Latin or Roman Catholic churches, and to some extent also by some Protestant theologians: they are the first Council of Nice, held in 325; the first Council of Constantinople, 381; the Council of Ephesus, 431; the Council of Chalcedon, 451; the second Council of Constantinople, 553; the third Council of Constantinople, 680; and the second Council of Nice, 787. Other important councils regarded by the Roman Catholic, but not by either the Greek or the Protestant communion, as ecumenical are the Council of Trent (1545–63) and the Council of the Vatican (1869–70). The Anglican Church receives the first six councils. (b) An advisory assembly of clerical or clerical and lay members in certain Reformed denominations.—8. Any body or group of persons wielding political power.

See *Congregational council*, above.—**Orders in council**. See *order*.—**Privy council**, a board or select body of personal counsellors of a chief magistrate in the administration of his office; specifically, in England, the principal body of advisers of the sovereign; the name borne since the fifteenth century by the ordinary council, which superseded the ancient curia regis in the reign of Edward I. The privy counsellors are nominated at the pleasure of the sovereign, excepting certain persons appointed ex officio, and include at present princes of the blood, principal members of existing and past governments, the archbishops, and many of the nobility—in all, over 200 members. Its administrative functions are exercised chiefly by committees, as the Board of Trade, the Local Government Board, etc. The Judicial Committee of the Privy Council, composed of the lord president, the lord chancellor, and others, has high appellate jurisdiction. Politically the importance of the Privy Council has been superseded by a committee of ministers belonging to it, called the *Cabinet*. (b) Less strictly, any imitation of such a thing and for such a purpose, as a genuine farthing gilded to pass for a sovereign, or a coin clipped at the edges and then milled, to give it the appearance of a fresh coin, or a fraudulent imitation of a bank-note. It has been held that a bank-note printed from a genuine plate, but having false signatures affixed in imitation of genuine ones, is more appropriately called a *forgery*; that such a note having fictitious or imaginary names affixed is more appropriately called *spurious*; and that only a note printed from a false plate is appropriately called a *counterfeit* note. But according to the strictest usage, it would be proper to say, in these several cases, respectively, that the milling was counterfeit, that the false signatures were counterfeit, and that naming the bank falsely with imaginary officers was a counterfeiting; and the better opinion is that a statute prohibiting counterfeiting may be deemed violated if any of the features of the genuine thing is counterfeited so as to serve the false purpose.

3. In *music*: (a) The art of musical composition in general. (b) The art of polyphonic or concerted composition, in distinction from homophonic or melodic composition. (c) Specifically, the art of adding to a given melody, subject, theme, or canto fermo, one or more melodies whose relations to the given melody are fixed by rules. Strict or plain counterpoint, which began to be cultivated in the thirteenth century, and attained great extension and perfection in the fifteenth, is usually divided into several species: (1) *note against note*, in which to each note of the cantus is added one note in the accompanying part or parts; (2) *two against one*, in which to each note of the cantus two notes are added; (3) *four against one*, in which four notes are added; (4) *syncopated*, in which to each note of the cantus one note is added after a constant rhythmic interval; (5) *stord* or *figured*, in which the added part or parts are variously constructed. The melodic and harmonic intervals permitted in each species are minutely fixed by rule. Counterpoint is *two-part* when two voices or parts are used, *three-part* when three are used, etc. It is *single* when the added part uniformly lies above or below the cantus; *double* when the added part is so constructed as to be usable both above and below the cantus by a uniform transposition of an octave, a tenth, or some other interval; and *triple* when three melodies are so fitted as to be mutually usable above and below one another by transposition. Among the forms of counterpoint, the canon and the fugue are the most important. (See these words.) Next to a pure and natural use of melodic intervals, various kinds of imitation between the voices are specially sought, such as augmentation, diminution, inversion, reversion, etc. (See these words.) The practice of counterpoint was specially prominent in the Gallo-Belgic school of musicians from the thirteenth to the sixteenth century, and it has been a part of musical training and accomplishment ever since. It is a necessary basis for all polyphonic composition, although in modern music the strictness of its early rules has been much relaxed. (d) A voice-part of independent character polyphonically combined with one or more other parts.—**Strict counterpoint**, counterpoint in which the use of unprepared discords is forbidden.

(a) Originally, the domain or territory of a count or earl. (b) Now, a definite division of a country or state for political or administrative purposes. In the United States the county is the political unit next below the State (except in Louisiana, which has an analogous division into parishes). Each county has, generally speaking, one or more courts, a sheriff, treasurer, clerk, and various officials engaged in the administration of justice, etc. The number of counties varies greatly in the different States. England has 40 counties (the greater number of which are also called *shires*), Wales 12, Scotland 33, and Ireland 32. For administrative purposes several of the historical counties of England are divided, and the county of London is added, bringing the total for England up to 50. An English county has a lord lieutenant, a custos rotulorum or keeper of records, a sheriff, and other officials. Certain larger British cities are counties in themselves, or counties corporate. Abbreviated Co. or co.

The town and the *county* have shaped the life of the States of the Union. In this respect there are three classes of States; those in which the town is the political unit—the six States of New England; the second, those in which the *county* is the unit—the States of the South; the third, those of the "compromise system," as it has been called—a mixed organization of *county* and township, prevailing in the Middle States and the West.

Austin Scott, Johns Hopkins Univ. Studies, III.

2. Collectively, the inhabitants of a county.—**County corporate**, in England and Ireland, a city or town possessing the privilege of being governed by its own sheriffs and other magistrates, irrespective of the county or counties in which it is situated, as Bristol, Newcastle, Dublin, etc.—**County palatine**, in England, formerly, a county distinguished by particular privileges: so called because the owner or holder had royal powers, or the same powers in the administration of justice as the king had in his palace

(see *palatine*); but all such powers are now vested in the crown. The counties palatine in England are Lancaster, Chester, and Durham, which were no doubt made separate regalities on account of their respective proximity to Wales and to that turbulent Northumbrian province which could be accounted a portion neither of England nor of Scotland.

II. *a.* Of or pertaining to a county: as, *county families*; *county society*.—**Board of county commissioners**, an elective board to which, in most counties in the United States, the administration of many important affairs of the county is intrusted. See *clerk*.—**County court**, a court having jurisdiction for a county, usually over actions for a limited amount, and often having some administrative powers, established to facilitate minor litigation. In early English history the county court was a local parliament, containing, in its full session, the archbishops, bishops, abbots, priors, earls, barons, knights, and freeholders, with representatives from each township and each borough. It sat once a month, but these monthly sessions were attended by none but those who had special business, and by the officers of the townships with their qualified jurymen. The existing county courts of England were established under a statute of 1846, each comprising a defined circuit, and sitting usually once a month in each of certain divisions called *county-court districts*. They have jurisdiction for the recovery of small debts, and also certain powers in equity and bankruptcy, and sometimes in admiralty. In the United States each county has a county court for local jurisdiction. In some of the States it is formed by associating all the justices of the peace of the county, and is charged with the administration of county police. See *police*.—**County rates**, in Great Britain and Ireland, rates which are levied upon the county, and collected by the boards of guardians, for the purpose of defraying the expenses to which counties are liable, as repairing bridges, jails, houses of correction, etc.—**County sessions**, in England, the general quarter sessions of the peace for each county, held four times a year.—**County town**, the chief town of a county; a county-seat.

The principal *coups d'état* in French history, distinctively so called, are that of November 9th, 1799 (18th Brumaire, year VIII., in the republican calendar), when Napoleon Bonaparte forcibly suppressed the Directory, and that of December 2d, 1851, when Louis Napoleon as president broke up the National Assembly by force of arms and made himself temporarily dictator, preparatory to becoming emperor as Napoleon III. a year later.

The news of the *coupe d'état* took England by surprise. A shock went through the whole country. Specifically—(a) In *organ-building*, a mechanical contrivance by which the keys of one keyboard are so connected with corresponding keys of another that when the former are depressed the latter are also depressed, and thus both can be played by a single motion. Manual couplers connect manual keyboards with each other; pedal couplers connect the pedal keyboard to a manual. Unison couplers connect keys of the same pitch; octave couplers (sometimes loosely called super-octave or sub-octave) connect keys an octave apart. Octave couplers are sometimes arranged between the keys of a single keyboard, so that it may be coupled with itself. Couplers operate in only one direction; that is, the second keyboard may be coupled with the first, but not the reverse. Also *copula*. Specifically—(a) In *music*: (1) A couplet. (2) A couple. (b) The general name for a great variety of mechanical appliances for uniting parts of constructions or parts of machines, for the purpose of adding strength, or of transmitting motion from one part to another, or of making a continuous passage, as for a liquid, a gas, or an electric current. A buckle, binding-screw, or fish-plate may illustrate the first; a clevis, a bell-coupling, shaft-coupling, or ear-coupling, the second; a pipe-coupling or binding-post, the last. In a narrower sense a coupling is: (1) A device for uniting the ends of shafting, or a coupling-box. (See cut under *coupling-box*.) Such couplings are divided into

two simple classes, those that are fixed permanently on the shafting and those that are adjustable, connected or not at will, or working automatically under variations of the power. Those operated by hand, whatever the particular application of the power, are called *shifting couplings*. The automatic couplings depend chiefly on friction, the adjustment being such that under a certain load the power is communicated, while a sudden addition to the load may exceed the friction and throw the coupling out of operation. (2) A device for uniting two railroad-cars in a train. The form at one time used almost exclusively in the United States, and still occasionally employed in freight-cars, is a single link or shackle fitting into jaws at the ends of the draw-bar and held in position by pins. This has been superseded on passenger-cars by self-acting couplings, consisting usually of hooked jaws, which slide past each other and are self-locking by means of springs or their own weight. Levers are also used to operate the couplings from the car-platform. Also called *coupler*. (c) The part which unites the front and rear axles, or the axle-bolster, of a carriage; the perch or reach. In some carriages the bottom of the carriage forms the only coupling. (d) The space between the tops of the shoulder-blades and the tops of the hip-joints of a dog.

The term denotes the proportionate length of a dog, which is spoken of as short or long in the *couplings*. V. Shaw, Book of the Dog.

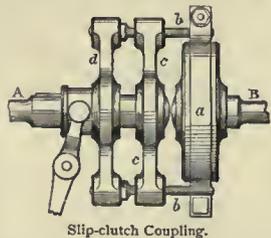

Ball-and-socket coupling. See *ball*.—**Differential coupling**, an extensible coupling designed for varying the speed of that part of the machinery which is driven.—**Disk coupling**, a kind of permanent coupling which consists of two disks keyed on the connected ends of the two shafts. In one of the disks there are two recesses, into which two corresponding projections on the other disk are received, and thus the two disks become locked together. This kind of coupling wants rigidity, and must be supported by a journal on each side, but it possesses the double advantage of being easily adjusted and disconnected.—**Dynamometer coupling.** See *dynamometer*.—**Flexible coupling**, a device for joining pieces of shafting which are not exactly in line, or of which the relative direction is varied in the course of the work, as in a dental engine. It consists of pairs of jointed arms united by universal joints, or of spiral springs fastened at each end to the two pieces of shafting that are to be united, or of plugs or rods of rubber fitted to the shafting.—**Flexible pipe-coupling**, a pipe-connection consisting of two bell-shaped joints with a short pipe between them, which fits into each bell and enables the two pipes to be laid out of line while yet keeping the joints tight.—**Half-hose coupling**, a coupling which has a sleeve at one end with an internal thread to receive a pipe, while a hose is bound on a corrugated tube-shaped portion at the opposite end.—**Half-lap coupling**, a kind of permanent coupling in which the boss-ends of the connected shafts are made semi-cylindrical, so that they overlap each other. The coupling-box is a plain cylinder bored to fit, and is kept in its place by a parallel key or feather, as shown in the annexed figure.—**Right-and-left coupling**, a turn-buckle.—**Sleeve coupling**, a tube within which the abutting ends of shafting are coupled together.—**Slip-clutch coupling**, a form of coupling belonging to the class of friction-couplings. It is represented in its best form in the annexed figure. On the shaft B is fixed a pulley, which is embraced by a friction-band *a* as tightly as may be required. This band is provided with projecting ears, with which the prongs *b* of a fixed cross *d* on the driving-shaft A can be shifted into contact. This cross is free to slide endwise on its shaft, but is connected to it by a sunk feather, so that being thrown forward into gear with the ears of the friction-band, the shaft being in motion, the band slips round on its pulley until the friction becomes equal to the resistance, and the pulley gradually attains the same motion as the clutch. The arms and sockets *c*, which are keyed fast on the shaft A, are intended to steady and support the prongs, and to remove the strain from the shifting part.—**Square coupling**, in *mill-work*, a kind of permanent coupling of which the coupling-box is made in halves and square, corresponding to the form of the two connected ends of the shafts. The two halves of the box are bolted together on the opposite sides, as represented in the annexed figure.—**Thimble coupling**, a kind of permanent coupling in which the coupling-box consists of a plain ring of metal, supposed to resemble a tailor's thimble, bored to fit the two connected ends of the shafts. The connection is secured either by pins passed through the ends of the shafts and the thimble, or by a parallel key or

coupon (kó'pon), *n.* [*F.* *coupon*, a remnant, a coupon, *< couper*, cut: see *coupl*, *v.*] A printed certificate or ticket attached to and forming part of an original or principal certificate or ticket, and intended to be detached when used. Specifically—(a) An interest certificate printed at the bottom of a bond running for a term of years. There are as many of these certificates as there are payments to be made. At each time of payment one is cut off and presented for payment. In the United States coupons are negotiable instruments on which suits may be brought though detached from the bond. A purchaser of an over-due coupon takes only the title of the seller. Negotiable coupons are entitled to days of grace. (b) One of a series of conjoined tickets which bind the issuer to make certain payments, perform some service (as transportation over connecting railroad lines), or give value for certain amounts at different periods, in consideration of money received. At the settlement of each claim a coupon is detached and given up.

See *Virginia coupon cases*, under *case* 1.—**Coupon ticket**, a ticket of admission to a place of amusement, entitling the holder to a specified seat, and printed in two parts, of which one is torn off and returned to the holder on entering.—**Virginia coupon cases**. (a) In England, a general designation of the courts of Chancery, Queen's Bench, and former Common Pleas and Exchequer, which are now, however, divisions of the Supreme Court. In Scotland the superior courts are the Court of Session, Court of Justiciary, and Court of Exchequer. (b) A designation frequently prescribed by law, particularly in the United States, for a local court in a particular county or city, superior in jurisdiction to the lower class of inferior courts existing in the counties and towns throughout the State; as, the *Superior Court* of the city of New York; the *Superior Court* of Cincinnati; the *Superior Court* of Cook county (Chicago). In Connecticut and Georgia the highest court of original jurisdiction is termed the Superior Court. In Kentucky the name is given to an intermediate court of appeal.—**Supreme Court**, the designation usually prescribed by law for the highest court of the state or nation which has any original jurisdiction of a general nature. In the United States the name is usually given to the court having a general appellate jurisdiction over inferior courts, and original jurisdiction to supervise the proceedings of inferior courts and of public officers, by the special writs of mandamus, certiorari, prohibition, habeas corpus, quo warranto, and the like. The term has no fixed general meaning apart from the statute conferring it. For instance, in many States the jurisdiction of the Supreme Court is purely appellate and supervisory. In England the Supreme Court includes the various divisions, Chancery, Queen's Bench, etc. (formerly called the Superior Courts, which have original and appellate jurisdiction), and the Court of Appeal (which has no original jurisdiction, but reviews the proceedings of the various divisions); and the decisions of the Court of Appeal are in turn reviewed by appeal to the House of Lords. In New York the name is given to the court having general original jurisdiction at law and in equity throughout the State, of all classes of actions, civil and criminal, except such minor, local, and peculiar matters as for reasons of convenience are confined in the first instance to inferior courts; and its final judgments are for the most part subject to review in the Court of Appeals. But it has also appellate jurisdiction over many inferior courts. In New Jersey the Supreme Court has both original and appellate jurisdiction at law, while the equity jurisdiction is vested in the Court of Chancery, and both are subject to review in the Court of Errors and Appeals. In Connecticut the court of general original jurisdiction in law and equity is termed the Superior Court, and the appellate court is termed the Supreme Court of Errors. In Kentucky the term Superior Court is given to an appellate court, whose decisions are in turn reviewed by a Court of Appeals. The Supreme Court of the United States has original jurisdiction in cases affecting ambassadors and other public ministers and consuls, and those in which a State is a party. Its principal business is in the exercise of its appellate jurisdiction, which includes (subject to complex restrictions in many classes of cases) civil cases in the courts established by act of Congress; federal questions determined in State courts of last resort adversely to a claim of federal right; and a supervisory jurisdiction over criminal proceedings in United States circuit courts when two judges are disagreed.—**Surrogate's court**, in some of the United States, a probate court.—**The courts of the Lord**, the temple at Jerusalem; hence, a church or public place of worship.

The custom was observed, according to Diodorus, among the Corsicans; and Strabo notices it among the Spanish Basques, by whom, as well as by the Gascons, it is said still to be practised.
